from Cutch, Ahmedabad, Surat, and Dharwar, on the western side of India; and from the central territories of the Nizam, and of the Rajah of Nagpore. The finest pieces of calico, and Punjum longcloth, were sent from Juggiapettah, in the Northern Circars, which was formerly the great seat of this manufacture. It is curious that some of these places, noted even for their manufactures, did not grow their own cotton. Dacca, no doubt, grew most of what it required for its muslins, because the thread did not swell in bleaching, but it also imported cotton formerly from Surat, as well as from Central India. Azimgurh imports its cotton chiefly from the same source to which the Northern Circars was also formerly indebted, while Chundeyree imports its cotton from the distant valley of Nimur. Among the fabrics there were a great variety, which proves that the natives are acquainted with every kind of weaving, from guzzees and gauzes, to striped, chequered, and flowered muslins. The last are interesting as specimens of an art which has been long known in the East, and the mode of making which has often puzzled weavers in this country. In manufacturing figured (*jamdanee*) fabrics, Mr. Taylor informs us, they place the pattern, drawn upon paper, below the warp, and range along the track of the woof a number of cut threads, equal to the flowers, or parts of the design intended to be made; and then with two small fine pointed bamboo sticks, they draw each of these threads between as many threads of the warp as may be equal to the width of the figure which is to be formed. When all the threads have been brought between the warp, they are drawn close by a stroke of the ley. The shuttle is then passed by one of the weavers, through the shed, and the weft having been driven home, it is returned by the other weaver." Most of these flowered muslins are uniform in colour but some are in two colours, and chiefly woven in Bengal. Specimens of double weaving in cotton, and showing considerable skill, with a pleasing arrangement of pattern and colours, were sent from Khyrpore, in Sindh. These are also woven in Ganjam. Flax, hemp, and substitutes for them are all well known and extensively cultivated in every part of India; but flax is so solely on account of its seeds, which yield oil and oil cake, though some very good flax has been produced in some parts of Bengal; and the hemp, on account of the intoxicating principles secreted in its leaves and green parts, and which in different forms is known under the name of *Bhang, husheesh, churus*. The fibre of the plant, as grown in the plains is too dry and brittle to be useful either for rope making or for textile fabrics, though in the Himalayas some excellent ropes and canvas are made, and the culture might be greatly extended if there was demand for the produce. Species of crotalaria, of hibiscus, of corchorus and of many other genera, yield fibres which are used for rope-making; but that of the species of corchorus, commonly called *jute*, for making *gunny* bags, used for packing, which are even exported to America for packing their cotton. In the Peninsula these bags are made of *Crotalaria juncea*, or *goni* plant. The Rhea fibre, which is closely allied to, if not identical with, the China grass, is used for making fishing-lines and some kinds of fabric, but its employment may be greatly extended. So also the plantain, the pine-apple, and the sanseviera fibre, of all of which some fabrics have been made and exhibited, but in too small quantities to attract much attention, though some will probably become important articles of commerce.—*Royle, Arts &c. of India, page* 487 *to* 494.

(8145) THALICTRUM (from the Greek θάλικτρον), a genus of Plants belonging to the natural order *Ranunculaceæ*. It consists of herbs which have usually a fetid smell like rue, and hence are called Meadow Rues. The species have perennial roots with annual stems. The flowers are corymbose, panicled, and somewhat racemose, of a green, white, or yellow colour; they have no involucre and no petals; the calyx is composed of 4 or 5 petal-like sepals; carpels 4-15 in number. Upwards of 50 species are enumerated, which are mostly natives of the temperate and colder parts of the world.—*Eng. Cyc.*

(8146) THALICTRUM FOLIOLOSUM, (*Vern.* Peli juree; Shuprak.) This plant is found at Mussooree, and generally on the Himalayas. Specimens of the roots were sent by Dr. Falconer of Seharunpore. Another species of Thalictrum (flavum) is common in France, where it is termed " the poor man's rhubarb", as a substitute for which medicine it is generally employed. The Indian species is easily procurable from the hills, though not known in the bazars of the lower provinces. The root deserves extensive trial, and promises to succeed well as a febrifuge of some power, and a tonic aperient of peculiar value.—*O' Shaughnessy, page* 161.

(8147) THALLOGENS, a class of Plants proposed by Lindley to include those Flowerless Plants which are distinguished by the absence of an axial stem. It includes all the *Cryptogamia*, with the exception of Ferns and Mosses. [ACROGENS.] —*Eng. Cyc.*

(8148) THANICOY. *Tam.* TERMINALIA BELLERICA.

(8149) THANY MARUM, a tree common about Nelamboor and in Coorg; wood much used but not durable, being very liable to be attacked by insects.—*McIvor. M. E. J. R.*

(8150) THATCH. In the Peninsula of India the ordinary thatch in use with the people, is made of Palmyra leaves: This is the best thatch for houses and the most durable. Next to it in Madras, ranks in value a grass which

grows on the banks of rivulets, in the low country, and is called "*Koary*," *Cyperus textilis*. The leaf of the Cocoanut, is a very perishable material and only employed by the very poor. In the Dekhan a long grass is chiefly used. The Karens in Burmah use the large palmated leaf of a tall wild palm, a species of *Livistonia*, but the Europeans and Burmese use the leaves of the "Nipa." The Karens in Amherst province employ the tall grasses "*Imperata Cylindrica*," "*Saccharum Cylindricum*," and *S. Spontaneum. Ed.* Long grasses and Sedges (*Arundo, Saccharum* and *Scleria*,) are cut and stacked along the water's edge of the Burhampooter in huge brown piles, for export and thatching.—*Hooker, Him. Jour. Vol.* II, *page* 373.

(8151) THEA, a genus of Plants belonging to the tribe *Camellieæ* and natural order *Ternstromiaceæ*, which has been so named from the slightly altered Chinese name of the dried herb which now forms the almost universal beverage of the British Isles. Though now so extensively employed, the introduction of tea into Europe is of comparatively recent origin. Tea however must have been used in China from very early times. It is differently named in different parts of China, as Tcha, or Cha, also Tha, whence we have Tsia, The, and Tea. In Persian works in use in India, tea is called Cha-i-Khutai, or Tea of Cathay. The genus *Thea* is characterised by having a calyx which is persistent, without bracts, 5-leaved, leaflets imbricated, the outer ones smaller; petals of the corolla 6 to 9, hypogynous, imbricated, the inner ones the largest, all adhering together at the base; stamens numerous, in several rows, adhering to the bottom of the petals; filaments filiform, anthers incumbent, 2-celled, oblong, with a thickish connectivum, cells opening longitudinally; ovary free, 3-celled; ovules 4 in each cell, inserted alternately into the central angle, the upper ones ascending, the lower pendulous; style trifid, stigmas 3, acute; capsule spheroidal, 2-3-lobed, 3- or by abortion 2-celled, with loculicidal dehiscence, or with the dissepiments formed from the turned-in edges of the valves; seeds solitary or rarely two, in cells, shell-like testa, marked with the ventral umbilicus; cotyledons thick, fleshy, oily; no albumen; radicle very short, very near the umbilicus, centripetal. The genus *Camellia* is usually considered to be very distinct from *Thea*; indeed by Cambesedes the two are separated from each other by several intervening genera: they are however too closely allied to allow of this separation. Distinctions have been made in the fruit of the two genera. That of *Thea* is 3-lobed with obtuse corners, and opening along the middle of the lobes, that is, having the dissepiments opposite to the valves, or, as expressed by modern botanists, having a loculicidal dehiscence. *Camellia*, on the contrary is described as having its fruit obscurely triangular, without any tendency to become deeply 3-lobed, with the margins of the valves turned inwards and forming the dissepiments, which thus alternate with the valves, and have what is now called a septicidal dehiscence. Mr. Griffith, on the contrary, who is well qualified to form a correct opinion, states, from examination of the Assamese tea-plant and of two species of *Camellia* from the Khosiya Hills, that there is no difference between *Thea* and *Camellia*. The dehiscence in both, he says, is of the same nature, that is, loculicidal, and the only difference that does really exist is simply of specific value, consisting in the fruits of the tea-plant being 3-lobed, of the *Camellia* triangular. The species of the genus *Thea* are few in number; some botanists are of opinion that even these are varieties of a single species. —*Eng. Cyc.*

(8152) THEA ASSAMENSIS, the Assam Tea-Plant, which some years ago began to attract so much attention, seems to partake of the characters of both the foregoing. The Calcutta Tea Committee say, in 1835, "We are now enabled to state with certainty, that not only is it a genuine tea, but that no doubt can be entertained of its being the identical tea of China, which is the exclusive source of all the varieties and shades of the tea of commerce." To this it may be replied, that there are considerable doubts whether the teas of commerce are all derived from one species of plant. Mr. Griffith says, in the size both of the plant and of the leaves, as well as in the texture of these last, and in its stations, the Assamese plant approaches to the green tea-plant of China; in its geographical distribution, so far as latitude is concerned, it approaches to the black tea. The inflorescence of the Assamese plant varies, but perhaps its usual state is to have the flowers solitary in the axils of the leaves, but the number of flowers varies from one to five. The plants introduced into England have their leaves much larger and thicker than those of the green tea plant, and Messrs. Loddiges find that it requires a much greater degree of heat, in fact that of the hot-house, while the others are in the open air for a great part of the year.

Two other species, described by Loureiro, are little known, as

(8153) THEA VIRIDIS, a large, strong-growing, almost hardy plant, with spreading branches, its leaves three to five inches long, thin, almost membranous, very broadly lanceolate, light green and wavy, with large and irregular serratures, the flowers large, usually solitary, mostly confined to the upper axil, with 5 sepals and from 5 to 7 petals; fruit nodding. This species is figured by Dr. Lettsom in his account of the tea-plant, t. 1. and by Sir W. J. Hooker, 'Bot. Mag.,' t. 3148, and in Loddiges' 'Bot. Cap.,' t. 227, all from plants which have flowered in England. Kæmpfer

supplies a very good figure, 'Amœn. Exot,' p. 607, from a Japanese plant. This species is found both in China and Japan, and is supposed to be the species which yields the green tea of commerce. It has been long introduced into England, having been first sent from Japan in 1687 to the Cape of Good Hope, and thence into Europe.—*Eng. Cyc.*

(8154) THEA BOHEA—is a smaller plant than *T. viridis*: its branches are stiff and straight, its stem erect, the leaves not above half or two thirds of the size of the former species, elliptical oblong, perfectly flat, more coriaceous, of a dark green colour, with small and even serratures; they are numerous, and have in their axils two or three flowers, of 5 sepals and 5 petals: these are smaller and have a slight fragrance, and flower later in the season than *T. viridis*. The plant is much more tender than the green tea-plant, and unable to stand the cold of an English climate. It is supposed by some to yield the leaves which are converted into black tea, and, notwithstanding contrary statements, leaves similar to those of this plant may be recognised on infusing and spreading out the leaves of some of the black teas of commerce. [TERNSTROMIACEÆ.] A variety of this is sometimes called *T. stricta*. It is figured by Lettsom, ed. 2, p. 41, who considers it only a variety of the former. It is also figured by Loddiges, 'Bot. Cab.,' t. 226, who, as well as Sir W. J. Hooker and Dr. Royle, considers it to be a distinct species.—*Eng. Cyc.*

(8155) THEA COCHINCHINENSIS, about eight feet high, having lanceolate leaves, flowers of three to five sepals and five petals, solitary, terminal; found wild in the north of Cochin-China, where it is also cultivated being used medicinally by the natives as a diaphoretic.

(8156) THEA OLEOSA is also a shrub of eight feet high, found in the fields in the neighbourhood of Canton, and named from its seeds yielding a large quantity of oil, which is used for burning and as an article of diet. The leaves are lanceolate, the flowers of six sepals and six petals, peduncles 3-flowered, axillary; fruit stated to be indehiscent, rather a berry than a capsule.—*Eng. Cyc.* See TEA.

(8157) THEACEÆ, *Mirbel.* CAMELLIEÆ *Dec.* a tribe of TERNSTRŒMIACEÆ.

The genus Thea forms a small group of plants with Camellia, and is remarkable for containing the plant or plants which yield the different kinds of Tea imported from China. The question was long undecided whether all the kinds of Tea are made or can be made, from the same plants, by variations in the process; or whether it is perferable to have different varieties or kinds of plant for the distinct varieties of Tea, as, for instance, the Green and Black Teas; whether these were originally distinct species, or varieties owing to difference in soil, climate, or culture. Dr. Royle has always been inclined to think the latter the more probable opinion, as fully detailed in his "Illustr. of Himalayan Botany," p. 107 to 128, and in his "Productive Resources of India," p. 257 to 311. Two plants are known in the gardens: one called *Thea viridis*, supposed to yield Green Tea, including—1. Imperial. 2. Gunpowder. 3. Hyson. 4. Young Hyson. 5. Twankay. This kind is capable of withstanding a greater degree of cold, and survives through the winter in the open air in Great Britain, as may be seen in Kew Gardens. Green Teas we know are chiefly produced in the more northern districts of China. Some are factitiously coloured with Indigo and Sulphate of Lime, and Mr. Warington has ascertained that of the Green Teas of commerce some are *unglazed*, others *glazed*. The former are of a yellow, brown tint, tending on the ribbed parts to a blackish hue without a shade of green or blue; while the *glazed* are faced or covered superficially with a powder consisting of Prussian Blue and Sulphate of Lime, or Kaolin, with occasionally a yellow or orange-coloured vegetable substance. Indigo with Gypsum is sometimes used, as by the China tea-makers sent to Assam. Even the *unglazed* have a little Sulphate of Lime attached to their surface, either to act as an absorbent of moisture, or to give the bloom chracteristic of the green teas of commerce. The *Thea Bohea* appears distinct as a species from the former, and has been supposed to yield the different kinds of Black Tea, that is, Pekoe, Lapsang, Souchong, Congou, Bohea, &c., the last being the inferior, and the Pekoes the best kinds of Black Tea. Plants collected in Chusan are somewhat intermediate in character. That growing wild in Assam is considered by some botanists to be another distinct species of Thea or of Camellia. But the information is too defective for any decisive opinion to be formed. If we compare the recent analyses as that of Mulder, *v.* Pereira, Treatise on Food and Diet, p. 394, of green and of Black Tea, it would appear that a less degree of heat and younger leaves being employed, would explain some of the differences between Green and Black Tea.

Some Tea has been manufactured in the Government Nurseries in Kemaon from plants grown from China seed, which has been pronounced of the finest quality by the best Judges, and compared with the Oolong Teas of the Ankoy district. Some prepared in August, 1845, in the Tea Nursery in the Deyra Doon, has also been pronounced of fine quality, and compared with Orange Pekoe.

The properties of Tea depend chiefly on the presence of Tannin, of a Volatile Oil, and of principle called *Theine* ($C_8H_5N_2O_2$), which has been found to be identical with *Caffeine* and is a salifiable base. It may be obtained in white silky needles, has a

mild bitter taste, is soluble in hot, but sparingly so in cold water and Alcohol. With sulphuric acid and hydrochloric Acid, it forms crystalline compounds, and is supposed to exist in Tea in combination with Tannic Acid. The quantity of Tannin is stated by Brande, and as appears by the taste, and in the analyses of Mulder, to be greater in Green than in Black tea. Sir. H. Davy and others have stated that Black Tea contains the largest proportion of Tannin. The volatile Oil is in larger quantity in the Green than in the Black Tea. Tea is well known for its astringent and moderately excitant properties, chiefly affecting the nervous system, producing some degree of exhilaration, and of refreshment after fatigue. Its effects are well seen in the wakefulness produced, especially by Green Tea, in those unaccustomed to its use. But it is thought by some to act as a sedative on the heart and blood-vessels ; or, as Dr. Billing explains it, Tea and Coffee are sedatives and relieve the stupor produced by stimulants, or the drowsiness of fatigue, or other plethora, only by counteracting the plethoric state of the brain inducedby the continued stimulation of action—thus merely restoring the brain to its normal state. Liebig (*Anim. Chem.* p. 179) has suggested that *Theine*, as an ingredient of diet, may be useful in contributing to the formation of Taurine, a compound peculiar to Bile. Besides being useful as a diluent, it may often be prescribed as an agreeable and refreshing beverage ; in some cases, especially when made strong, acting as an excitant, and at other times producing sedative and calming effects.—*Royle.*

(8158) THENG-BAN-SHA, a bast of Arracan. Coarse looking, and of a reddish brown colour, but divisible into a number of very thin layers, with a good deal of flexibility and some toughness.—*Royle.*

(8159) THEOBROMA (from θεὸς and βρωμα, the food of gods), a genus of Plants belonging to the natural order *Sterculiaceæ*, (*Byttneriaceæ*, *R. Brown*,) the species of which yield the Cocoa of commerce. They are trees with large simple leaves and with the flowers in clusters. The calyx is composed of 5 sepals ; the petals are 5, lengthened into a strap-like form at the apex ; the stamens are 5, each with double anthers and a horn-like appendage between each filament ; the style is filiform, with a 5-parted stigma ; fruit a 5-celled capsule without valves ; seeds imbedded in a soft pulp ; no albumen, and thick oily wrinkled cotyledons.—*Eng. Cyc.* There are several other species of *Theobroma* yielding seeds possessing the properties of the above, but they are not cultivated or employed to the same extent. They are all of them natives of South America, and used by the inhabitants where they grow as food. *T. Guazuma* of Linnæus, the Bastard Cedar, or Orme d'Amerique, now the *G. ulmifolia*, is a native of the West Indies, and is a handsome tree resembling the elm.—*Eng. Cyc.*

(8160) THEOBROMA CACAO, Common Cacao, or Chocolate Nut-Tree, has entire, elliptic, oblong, acuminate, quite smooth leaves, and oblong smooth fruit. This tree is indigenous in South America, and is generally found at a height of 600 feet above the level of the sea. It is however extensively cultivated in the West Indies, and in the tropical parts of Asia and Africa. The Mexicans call the tree Chocolalt, hence our word Chocolate for the prepared seeds. The capsules of the fruit are large, and contain each about 25 seeds : the pulp in which these are enveloped has a sweet and not unpleasant taste, and is frequently eaten where the tree is grown. The trees are evergreens, and bear fruit and flowers all the year through, but the usual times for gathering the fruit are in June and December. The cotyledons of the seeds contain a large quantity of oily albumen, which has an agreeable flavour, and on this account they are not only used as a principal article of diet by the natives of the countries in which they grow, but are now used for the same purpose throughout the civilised world. The composition of these seeds in which amylaceous matter is combined with oil, and a principle, called Theobromine, similar in its constitution to Thein and Caffein, is well adapted, when combined with sugar, to form a valuable article of diet. The oil contained in the seeds is sometimes obtained separately, and called cocoa-butter. It may be obtained easily by expression, especially if hot water is added. It is said to be very nutritive, and to act as an anodyne It is particularly recommended for making ointments. (Ersch and Gruber, ' Allgem. Encycl.,' art. Cacao.)—*Eng. Cyc.* This plant is described somewhat differently by Dr. Royle. He says, it is interesting in consequence of its seeds being largely employed in diet. The tree is a native of Mexico, but extensively cultivated in the West India Islands, and remarkable for its large and oval, yellow, cucumber-like capsules, hanging from the sides of the trunk and branches. These are divided into 5 cells, each filled with 8 to 10 ovoid seeds, piled one upon another, and covered by a membranous and succulent aril. There are several varieties of these seeds or *nibs*, which are more or less esteemed. The kernels of the seeds yield by pressure about one half their weight of a fatty oil, commonly called *Butter of Cacao*, at one time much lauded for its medical properties. The seeds, pounded, digested, and boiled with water, with the oil skimmed off, and sweetened with sugar and milk, afford a wholesome and agreeable beverage. The Cacao sold in the shops consists either of the roasted kernels and husks, or of the husks only, ground to powder ; it is sometimes made from the cake

left after expressing the oil from the beans. "Much of the cheap stuff sold under this name, is very inferior, being made with damaged nuts that have been pressed for the oil, mixed with potato-flour, mutton-suet, &c." (*Cooley.*) *Flake Cocao* is Cocao ground, compressd, and flaked by machinery. CHOCOLATE (from the Indian name *chocolalt*) is made by triturating in a heated mortar the roasted seeds without the husks, 10 lbs. with an equal quantity of Sugar, and about 1½ oz. of Vanilla, and 1 oz. of Cinnamon (*Cadet*) into a paste, which is put up in various forms. "The mass of the common Chocolate sold in England is prepared from the cake left after the expression of the oil, and this is frequently mixed with the roasted seeds of ground pea, and maize, or potato-flour, to which a sufficient quantity of inferior brown sugar, or treacle, and mutton suet is added to make it adhere together.—*Royle.* The chocolate-nut tree is seen in Tavoy gardens, and it brings its fruit to perfection.—*Mason.* This tree has been introduced into Travancore, where it thrives well, the fruit is round but smaller than that produced in South America.—*Riddell.* It thrives well in the Calcutta Garden. The nutritive properties of chocolate depend on a concrete oil or butter of most agreeable flavour, of which 1000 parts of the seed yield 386.—*O'Shaughnessy, page* 227. See CACAO.

The Wood.

Gungarave wood ENG. Gungaravae kurra, TEL.	Pao varasa marum. TAM.

Thespesia populnea, Poplar Thespesia, has roundish, cordate pointed 5-7-veined leaves, with dot-like scales beneath, with the peduncles equal in length to the petioles. This plant is a native of the East Indies, Guinea, and the Society Islands; and is known, where it grows amongst British colonists, as the Umbrella-Tree and Tulip-Tree. It attains a height of about 40 feet, and has large yellow flowers with a dark-red centre. In the tropics it has gained for itself a sacred regard, and is planted about monasteries and convents; hence the name Thespesia (divine). There are two species, natives of South America: they are all trees, with handsome showy flowers.—*Eng. Cyc.* This has been introduced into Tenasserim from the Madras Coast, and is quite an ornamental tree. Linnæus very appropriately named it the poplar hibiscus, for it has the leaves of the poplar with the flower of the hibiscus.—*Mason.* It is much used for avenues, being of quick growth, and yielding good shade This generally grows from the cuttings, and although the timber is strong, hard and durable, but rarely to be met with good, owing to the trees rotting at the heart. The tree abounds in old gardens, and about all European Stations, thriving best near the sea. (Wight, No 79, Mysore 9, Palamcottah 252, Hort. Garden 30.)—*M. E. J. R.* It furnishes a strong, hard and durable timber, but rarely to be met with good, owing to the trees rotting in the heart, it grows best near the Coast.—*Wight.* The juice of the fruit of this tree is said by Ainslie to be used as an external application in certain cutaneous affections and carapangs of children and a strong decoction of the bark is employed as a wash in the same complaints. The powder of the bark is prescribed, internally, as an alterative, *Ains. Mat. Med. p.* 103. &c. it affords a good wood for chairs &c. it is lighter than most woods, good colored, tough and takes a good polish.—*Rhode's M. S. S.*

(8164) THEVETIA NERIIFOLIA, EXILE TREE. Yellow Oleander.—This plant is common in the gardens of the Deccan; grows to the height of ten or twelve feet, with long tapering leaves; it is grown from seed, and blossoms throughout the year.—*Riddell.* It is a common ornamental shrub, in Calcutta. Its juice is acrid. Two grains of its bark has been affirmed to be equal to an ordinary dose of Cinchona. Ind. Ann. No. 6. Of this garden shrub

called the "Exile," the wood is worthless. (Hort. Garden 17.)—*M.E.J.R.*

(8165) THOMBATY. OLEUM CUCUMIS COLOCYNTHIS.

(8166) THORN APPLE. DATOORA.

Jowz-mazel, ARAB.	Gooz-giah, Bunjdeshtie, PERS.
Kala Datoora, BENG.	Kechubung, Roteeu. bung, MAL.
Kaloo-attana, CYNG.	Dutro, PORT.

Datoora, GUZ. HIND.	Nulla Oomatie, TEL.
Datura stramonium, LAT.	
Hummatoo, MAL.	
Umana, MALEAL.	

The whole plant (*Datura fastuosa*), has a rank odour, which may be detected at a distance. All parts possess medicinal properties. The seeds are brownish or black, flattened, kidney shaped, without odour, except when bruised, and have a bitter weakish taste. For the purpose of facilitating theft, and other criminal designs, the seeds are frequently given in India with sweetmeats, to stupify merely, but not with the intention of killing: although there is no doubt that for the latter purpose it has also been used. The root, dried leaves, capsules, and seeds of the Datura plants, are recommended by European medical practitioners in India, to be smoked in cases of spasmodic asthma.—*Faulkner.*

(8167) THREAD.

Garen, DUT.	Dagha GUZ. HIND.
Fil, FR.	Fio, PORT.
Zwirn, GER.	Nitki, RUS.
Refe, IT.	Hilo, Torzal, SP.

Thread is formed by twisting together fibres of cotton, silk, or flax.—*Faulkner.*

(8168) THRYSSA. THRYSSA-ANCHOVY. The genus thryssa, says Swainson, "has the general aspect of the anchovy, "engraulis," but the body is broader, the mouth enormous, and opening almost vertical." The species that inhabits Tenasserim waters may be denominated the thryssa anchovy.—*Mason.*

(8169) THUJA, or THUYA, a genus of Plants belonging to the natural order *Coniferæ*. This name is derived from *θύω*, as, on account of the pleasant odour given out by the wood in burning, it was used in ancient sacrifices. The species of this genus are more commonly known by the name of *Arbor Vitæ*. It belongs to the section of *Coniferæ* called *Cupressinæ* by Richard, in which genera, *Callitris*, *Taxodium*, and *Juniperus* are also included.—*Eng. Cyc.*

(8170) THUJA ARTICULATA of Desfontaines is now called *Callitris quadrivalvis*, Four-Valved Callitris. The genus *Callitris* differs from *Thuja* in having the scales of the female catkins, from 4 to 6 in number, opening like the valves of a regular pericarp, and the seeds at the base of these scales winged on the margin. The Four-Valved Callitris has flattened articulated leaves; the female catkin with 4 oval pointed valves, 2 of which have seeds. It is a native of Barbary, and attains a height of from 15 to 20 feet. It was first discovered by Desfontaines on Mount Atlas in 1796. [CALLITRIS.]—*Eng. Cyc.* Thuya articulata, is of middling height, sometimes reaching 15—20 feet; according to Schoust this tree produces the vernix, or sandarac.—*O'Shaughnessy, page* 621. Sandarach occurs in round or elongated tears, whitish or pale citron yellow, brilliant, transparent and limpid, brittle under the teeth, burns with a clear flame, soluble in alcohol and difficultly so in turpentine, odour, agreeable on burning Taste resinous and slightly balsamic used in varnishes, and its powder to prevent ink from spreading through unglazed or eroded paper. In Sweden a sandarac is sold, which is certainly supplied by one of the junipers of that country: indeed M. Fee assures us that the common junipers secrete a similar resin; he therefore considers its reference to the Thuya as extremely doubtful.—*O'Shaughnessy, page* 621.

(8171) THUJA ORIENTALIS, Oriental or Chinese Arbor Vitæ, has 2-edged branchlets; imbricated ovato-rhomboid adpressed leaves, fur rowed in the middle and in 4 rows; the canes elliptic, with the interior scales blunt, and mucronate beneath the apex. It is a native of rocky situations in Siberia and China and on the mountains of Japan.—*Eng. Cyc.*

(8172) THUJA PENDULA, Pendulous or Weeping Arbor Vitæ, has opposite decussating spreadinglanceolate, mucronate keeled, somewhat distant leaves; globose cones; convex, smooth scales; filiform pendulous branches. It is a native of Tartary, and is an elegant shrub.—*Eng. Cyc.*

(8173) THUNBERGIA (in honour of Thunberg the botanist), a genus of Plants belonging to the natural order *Acanthaceæ*. It has a double calyx, the outer one 2-leaved, the inner about 12-toothed. The corolla is campanulate; the capsule beaked and 2-celled. The species are handsome climbing plants with a fragrant odour, (*Eng. Cyc.*) with white, yellow, and blue flowers; they require a free rich sandy soil and plenty of drainage. The large varieties with blue flowers should be planted out and trained upon Pillars, trellises or trees. Nativesof the Tropics; raised from seeds, cuttings, layers, and suckers. —*Riddell.*

(8174) THUNBERGIA ALATA, ACANTHACEÆ.—These climbing plants bear flowers of various colours. The T. Grandiflora hangs in beautiful blue racemes, and is adapted for covering trellis work. The species are grown from seed, in any good soil.—*Riddell.*

(8175) THUNBERGIA FRAGRANS has a climbing stam, with cordate acuminate leaves somewhat angular at the base.

(8176) THUNBERGIA GRANDIFLORA has large flowers with no inner calyx ; the leaves are angular, cordate : the authers bearded and spurred. This and the former species are natives of the East Indies.—*Eng. Cyc.*

(8177) THUNBERGIA, THUNBERGIA. A large creeper with azure flowers belonging to the genus thunbergia is a conspicuous plant in the forests. I do not find the species described in any of the books to which I can refer.—*Mason.*

(8178) THYMELACEÆ, *Daphnads*, a natural order of Plants belonging to the tubiferous group of Incomplete Exogens. The name of this order is derived from *Thymelæa*, a plant spoken of by the ancients, and which some have supposed to be the *Daphne Gnidium*, a plant belonging to the present order. This order consists of shrubs or small trees, very rarely herbaceous, with non-articulate sometimes spiny branches having a very tenacious bark. The leaves are entire, simple, without stipules, and alternate or opposite. The flowers are capitate or spiked, terminal or axillary, occasionally solitary ; the calyx is tubular, coloured, 4-cleft, with an imbricate æstivation ; the stamens are 2, 4, or 8 in number, inserted into the tube with 2-celled anthers, dehiscing lengthwise in the middle ; the ovary is solitary, with a solitary pendulous ovule. The fruit is hard and dry, or drupaceous. The seed has little or no albumen, a straight embryo, with a short radicle and entire cotyledons. This order is related to *Santalaceæ*, from which it differs in its inferior calyx. It is also allied to *Elæagnaceæ* and *Proteaceæ*, from both of which it is distinguished by its pendulous ovules. Lindley refers to this order Partling's *Anthoboleæ*, on account of their superior fruit. The species are found in Europe, but are not common ; they occur in greatest abundance in the cooler parts of India and South America, at the Cape of Good Hope, and in Australia. The most prominent property of this order is their causticity, which resides in their bark. When applied to the skin it produces vesication, and pain in the mouth when chewed. The bark of several of the species is very tough, and may be manufactured into cordage. *Passerina tinctoria* yields a yellow dye, which is used in the south of Europe to colour wool. The various species of *Daphne* possess active properties ; some are used for dyeing, some are poisonous, and the *Daphne Lagetta* is the Lace-Bark-Tree of Jamaica. [DAPHNE.]—*Eng. Cyc.* According to Dr. O'Shaughnessy, this order of plants is very uniform in character, and is formed of shrubs or herbs with simple and alternate leaves, axillary or terminal flowers. Its most remarkable genera are the Daphne, Lagetta, and Dirca, from which some valuable medicines, and the celebrated Nipal paper are derived. Plants of this order are common in the central parts of temperate latitudes, and abound in the mountainous regions of Asia. A few are found in tropical latitudes, as Linostoma in Southern India. On the other hand, species of Daphne are common in the coldest latitudes. An acrid stimulant principle abounds in most of the species hitherto examined, and which possesses very valuable medicinal properties, though not devoid of dangerous powers, if taken in excessive doses. A crystaline substance named *Daphnine* has also been separated from the bark of some species of Daphne.—*O'Shaughnessy, page* 599.

(8179) THYMUS (*θύμος*) the name of a genus of Plants belonging to the natural order *Lamiaceæ* or *Lubiatæ*. It has an ovate bilabiate calyx with 13 ribs ; the upper lip is trifid, the lower lip is bifid with ciliated subulate segments, and throat villous inside ; the corolla with the upper lip erect, nearly plane, notched, lower patent and trifid ; stamens straight, exserted ; anthers 2-celled, styles bifid at apex. All the species are small under-shrubs with usually purplish flowers. Between 20 and 30 species have been described by botanists, most of them inhabitants of Europe, especially the region of the Mediterranean : one only is a native of the British Isles.

(8180) THYMUS CHAMÆDRYS, Wild Thyme, or Mother-of-Thyme, is a suffruticose plant, with whorled or capitate flowers, branched decumbent stems with plain ovate obtuse entire petiolate leaves, more orless ciliated at the base ; upper lip of the corolla ovate, 4-angular ; upper lip of the calyx with short ovate-lanceolate leaves, with subulate ciliated teeth. It is a native of Great Britain, on hills and in dry pastures, and throughout Europe and the north of Asia. This plant has the same sensible properties as the last. One of the varieties is known by the name of Lemon-Thyme, on account of its scent resembling the lemon.

(8181) THYMUS MASTICHINA, Mastich-Thyme, or Herb-Mastich, has ovate or oblong obtuse petiolate leaves, narrowed at the base and not ciliated ; the calyx is villous, with feathery subulate teeth, which are longer than the tube. It is a native of dry sandy uncultivated places in Spain, Portugal, and Barbary. It exhales a sent resembling mastich. It is the Marum Vulgare of older botanists, and at one time had some reputation as an Errhme.—*Eng. Cyc.*

(8182) THYMUS SERPYLLUM, Linnæus, appears to be different from the above, having uniformly hairy prostrate creeping stems distinct from the ascending capitate flower-stems. It is not a native of Great Britain. Thymus Serpillum is mentioned in the Ben. Ph. 228.

(8183) THYMUS VULGARIS, Common or Garden Thyme, Ipar, Hind : is an erect plant, or sometimes procumbent at the base, or clothed with a hoary pubescence ; the leaves are sessile, linear, or ovato-lanceolate, acute, with revolate

edges, fascicled in the axils; the teeth of the upper lip of the calyx are lanceolate, but the segments of the lower lip are subulate and ciliated. This plant is a native of the south-west parts of Europe, in dry plains and on hills, and uncultivated places free from woods. It is very much branched, and has purplish flowers. This species is cultivated for culinary purposes, and many varieties of it are met with in gardens. It has a pungent aromatic odour and taste.

Thymus vulgaris is a delicate plant to rear. Is best performed by seed, but it may be increased by slips, and dividing the root. It requires a rich soil, and the space of six inches between each plant. Best grown in pots. —*Riddell.* It is raised from seed, requires a sandy soil and free drainage, used in soups, &c. —*Jaffrey.*

(8184) TIDES. The usual vertical rise and fall of the tides in the straits of Malacca is from twelve to fourteen feet, while in other parts of the world in the same latitude there is scarcely any variation. The Tides at Singapore correspond in this respect with those in the straits. The vertical rise and fall of the tide upon the coast of Cochin-China varies from six to fourteen feet, and the periods and duration of the ebb and flood are by no means regular. In latitude 12°, on the same shore, there is but one tide in the course of twenty-four hours. It has been said that the tides in the tropics rise and fall very little. Although it is granted that in high latitudes the perpendicular flow and ebb is generally greater than in low, still there are many examples of considerable tides in the latter. At the head of the Gulf of Cambay, in latitude 22°, Horsburg states that the perpendicular depth of the rise and fall of the tides is from thirty six feet at the full and change of the moon. So also, according to the same authority, in Surat road, it is from twenty to twenty-one feet, and from fifteen to seventeen in Bombay harbour, again, in the Gulf of Martaban, which is far within the tropics, the rise and fall of the tide, at the full and change of the moon, is twenty-three and twenty-four feet, and of Rangoon bar about twenty or twenty-one feet. In Gasper straits, within 2½° of the equator, there is occasionally, from local causes, a rise and fall of sixteen or seventeen feet on the spring tide, but this is rare in places so near the equator. These instances, all from Horsburg, show that very considerable tides occur within the tropics.—*American Expedition to Japan, pages* 148 *and* 156.

(8185) TIELLA in Malayala and Tamil, a tree which is not much known in Ceylon. It grows from eight to twelve inches in diameter. It is used by the natives in the frames of country boats; and, from its strength and durability, is found to answer the purpose well.—*Edye, Ceylon.*

(8186) TIGRIDIA CONCHIFLORA. IRIDEÆ. Tiger Flower. These beautiful flowers are grown like other lilies, the flowers open in the morning, and are of a short duration: a second blossom appears on the same stem about the third day after the first has withered.—*Riddell.*

(8187) TIL. SESAMURM ORIENTALE.

(8188) TILES.

Tuiles, FR.	Tegole, Embrici, IT.
Dachziegel, GER.	Tscherepiza, RUS.
Kuprail, GUZ. HIND.	Tejas, SP.

Tiles are made of clay, and baked in an oven or in the open air, to harden them. They are of various shapes and sizes, and are used chiefly for covering roofs, and occasionally also, for paving floors and making drains.—*Faulkner.*

(8189) TILIACEÆ, *Lindenblooms*, a natural order of Plants belonging to the syncarpous group of Polypetalous Dicotyledons. This order consists of trees or shrubs, seldom of herbaceous plants, with simple, toothed, alternate leaves, furnished with stipules. The flowers are axillary. The calyx consists of 4 or 5 sepals, which are valvular in æstivation; the petals 4 or 5, with mostly a little pit at their base; the stamens are hypogynous, mostly indefinite, with oval or roundish 2-celled anthers bursting lengthwise; the disc is formed of glands, which are equal in number to the petals and opposite to them; the ovary is single, composed of from 4 to 10 carpels, with a single style and stigma divided into lobes according to the number of the carpels; seeds numerous, with erect embryo, and abundant albumen. This order is nearly allied to *Sterculiaceæ* and *Malvaceæ*, from which it differs in its glandular disc, distinct stamens, and 2-celled anthers. The species, of which there are about 250, are arranged in 32 genera, and are generally diffused throughout the tropical and temperate parts of the globe.

Tiliaceæ possess no active properties; they abound in a mucilaginous wholesome juice. The fibres of the inner bark are very tough, and are used for a variety of economical purposes. [TILIA.] The wood is generally white, light, and tough; that of *Grewia elastica*, is used for making bows in India. The Trincomalee-Wood used at Madras for making the Massoola boats is the produce of *Berrya Ammonilla*. The *Corchorus olitorius* is cultivated in Egypt for use as a pot-herb.—*Eng Cyc.*

(8190) TIMALIA (Horsfield), a genus of Birds thus characterised:—Bill strong, compressed, deep (altum). Nostrils subrounded. Wings short, rounded. Tail elongated and graduated. Feet strong; hind-claw twice as large as the middle anterior claw.

(8191) TIMALIA PILEATA. Body ovate, rather stout. General colour above, brown with an olivaceous tint; underneath, testaceous inclining to gray. Head capped with saturated chestnut. Throat and cheeks white. Breast white inclining to gray, marked, with intensely black

stripes by the shafts of the plumes. Bill black and shining. Feet brown. (Horsfield.) Dr. Horsfield observes that the species is not unfrequent in the groves and small woods which abound throughout Java. It often, he says, approaches villages and plantations constructing its nest in the hedges; and he speaks of it as one of the social birds that delight to dwell in the vicinity of cultivation. In large forests he did not notice it. He describes its flight as low and interrupted, and adds that wherever it resides it is a welcome neighbour, in consequence of the peculiarity and pleasantness of its note, which consists of a slow repetition of the five tones of the diatonic scale (C, D, E, F, G), which it chants with perfect regularity, several times in succession, and at small intervals of time. Dr. Horsfield further remarked that the sixth tone was sometimes added; but as this required apparently an extraordinary effort, it was by no means so agreeable to a musical ear as the simple repetition of the five notes, which appear to be the natural compass of the bird's organs. ('Zoological Researches in Java.')

(8192) TIMBER TREES, TIMBER AND FANCY WOODS OF EASTERN AND SOUTHERN ASIA.—The preservation of the Forests of India and the search for timbers and fancy woods, suitable for the purposes of the State and wants of the people, have long been objects of attentive interest to the Governments of the several Presidencies in India. Amongst the earliest of the scientific investigators we find recorded the names of Dr. Roxburgh, Dr. Ainslie, Dr. Wallich, Dr. Royle, Dr. Gibson, Dr. Falconer, Dr. McClelland, Mr. Graham, Dr. Wight, and Revd Mr. Mason; while Mr. Edye, Colonel Frith, Captain Dance, and Mr. Rohde, may each be mentioned as having applied a large practical knowledge of the qualities of timber, to ascertain the woods suitable for the manufacturing industries of India. The course adopted by the principal of the scientific inquirers in identifying the plants, has been to endeavour to identify the tree botanically, and then supply the names by which it was familiarly known to the people of the country, and there is no doubt that if not the only proper mode, it is a more correct method than to endeavour to trace out the botanical name of a plant from its native name. In following the latter course, it is impossible but that, from the twenty or thirty languages spoken all throughout the regions of which we are endeavouring to record the products, the same plant must come to be described repeatedly under different names, and true progress will not be made until having properly identified the botanic relations of the plant, the subject be completed by endeavouring to supply all the synonyms by which it is known. The latter is the course that we will try to adopt in arranging the names of the trees producing the Timber and Fancy Woods of India and of Eastern and Southern Asia. One point which practical men should particularly be made aware of is that the vast extent of the regions we are describing, their various climates and physical conditions, render it impossible that the same tree can produce the same quality of timber in every locality where it grows, and this indicates the necessity of not pinning their faith on to any one wood merely because a wood from the same tree, the growth of another district, may have been found highly suitable for the work to which it was put. We would especially ask our ordnance friends to keep this point in view and not to use a wood however lauded, unless the timber have been brought from the same place as it was obtained by those whose praise they act on, or until severe trials has proved that when grown in the new locality, the timber it yields is equal to all that is required of it. As an instance of this, we may cite the majestic teak which grows to an immense height in Malabar, on the Godavery, in Pegu and Tenasserim, proceeds far into the interior of India, and may be seen in the mountains of Bundelcund, but there only in the form of a moderate sized shrub; and even where it presents the same form of a gigantic tree as in Malabar and Pegu, the quality of the timber it yields is essentially dissimilar. The knowledge of this fact renders it necessary that in our observations on the Timber trees, Timber and Fancy Woods of India and of Eastern and Southern Asia, we should not only note the trees generally, but furnish also the names of such as are found useful in certain districts. Our remarks will therefore embrace a few observations on the uses of timber, a list of all the trees known to produce timber in some part or other of the regions we are noticing, and separate lists and notices of the trees of particular districts.

The total annual importation of timber into Great Britain is nearly two million loads, or one hundred million of cubic feet, entered under the several designations of "timber or unsawn wood," "deals and planks or sawn wood;" "teak;" "staves," and "lathwood."

The following Table shows the countries from which wood was chiefly imported in the year 1849.

	Timber.	Deals.	Teak.	Staves.	Lathwood.
Russia,	41,419	173,586	—	825	15,589
Sweden,	28,679	79 843	—	150	1,119

Of the chief woods employed in shipbuilding seven have long been acknowledged as first-rate by the authorities at Lloyd's; and to this number must now be added an eighth, namely, iron-bark, which has, in fact, only been admitted as a first-class wood since the period of opening the Exhibition in May 1851. These eight woods are,

1 English oak,	5 East India teak,
2 American live oak,	6 Green heart,
3 African oak,	7 Morra,
4 Morung saul,	8 Iron bark.

At the great Exhibition of 1851, the collection of East Indian woods, exhibited by the Honorable East India Company (p. 884) was by far the most extensive series of woods in the whole Exhibition, and constituted a very valuable part of the great collection of Indian raw produce. It was remarkable for the large number of specimens, the excellence of many of them, and the valuable practical information to be gained by their examination. The collection consisted of many hundred specimens, and included several minor or local collections of great interest. Amongst these were the valuable collections of Drs. Roxburgh and Wallich (884,885); an extensive series of the woods of the Malay peninsula, Amherst, Tavoy, Tenasserim, Prince of Wales' Island, Assam, Cuddapah, Madras, Orissa, &c.

Considering the extent and importance of Dr. Wallich's collection, the Jury would certainly have awarded to him a medal had not the fact of his being a member of the jury precluded them from doing so. They awarded a Prize Medal to Mr. Commissioner Blundell (p. 885) for a very valuable collection of Amherst woods. They also awarded a Prize Medal to Messrs. Almeida of Singapore (p. 890) for fine specimens of Lingoa-wood and Kaya-buka.

The smaller series of woods contributed by Messrs. A. P. Onslow, of Ganjam; D. Mayne, of Cuddapah (p. 188); General Tulloch, Madras; Captain Ogilvie of Masulipatam; Major Maitland, and Colonel Balfour, of Madras; Dr. Hunter, of Madras; Dr. Wight, of Coimbatore; Captain Marquart, of Chittagong; and J. R. Colvin, of Moulmein (pp 888,891), were also severally deemed worthy of Honorable mention. The nature and properties of many of these Indian woods was very little known in Britain, and though, for the most part, it is not probable that it would be found worth while to import them into Europe, yet their importance to India is every year increasing, and must necessarily continue to do so, as the demand for timber in India for railways and other engineering works increases. For such uses it is desirable, not only that the wood should be strong and not liable to decay from mere exposure to the weather, but, also, that it should work freely, and be able to withstand the ravages of the various insects to which wood of all kinds is more or less exposed in tropical countries. It is true that even the most porous and spongy woods may be rendered to some extent capable of resisting all such influences, by being impregnated with various solutions, but it is obviously far better, when possible, to select such woods as are naturally saturated with resinous and aromatic substances, as in this latter case all cost of preparation is saved, besides that the preserving matter is far more perfectly disseminated throughout the whole of the wood than can possibly be effected by any artificial process after the tree is felled. In examining the comparative value of different sorts of wood, it is of the first importance to ascertain the nature of the encrusting matter deposited throughout the cells and tubes of the wood. For all practical purposes, those woods appear to be best in which the cells are lined with resinous matter; those filled with hygroscopic gummy matter are, for the most part, of less value; they are seasoned with difficulty, and are always more liable to decay. The best woods are those having a strong fibre protected from all external influences by a coat of resinous matter, or at least of a matter insoluble in water, and one which does not attract atmospheric moisture. It is probable also, that some of the ornamental and other woods of India will become articles of import into Britain when their properties and uses are better known and appreciated by that country's artizans.—*Jur. Rep. of* 1851.

Timber.—The most important application of wood is in the building and repairing of houses and ships, and in the construction of machinery. For this purpose the larger trees, which come under the denomination of timber, are chiefly employed. Though England long supplied its own wants, increasing population, led to an extensive demand on other countries for the supply of timber, which was met chiefly by vast pine forests on the shores of the Baltic and northern Europe, and also from Canada. Timber from the latter country, however, was soon found to be inferior in strength and durability to that of the north of Europe, and fell into disesteem among ship builders; hence arose the practice of introducing the words "Memel fir" in specifications for building.

Conservation.—The preservation of growing timber is an art of considerable importance, and can only be said to be cultivated in countries where timber is comparatively scarce.

The practice of thinning out plantations is of importance not only as affording a supply of wood, but, by admitting an increased supply of air and light to the remaining trees, their growth is greatly promoted. Forest trees are often planted on soil that is unfit for other purposes, and by the annual fall of leaves they accumulate in time a certain depth of soil.

Seasoning.—The proper time for the felling of trees is that in which the largest quantity of hard and durable wood can be obtained

as free from sap as possible. It is a common fault to fell trees before they have attained their maturity. If suffered to complete their growth they would have the heartwood of equal weight and strength throughout, whereas in those cut down prematurely, the centre wood alone possesses this requisite, the outer concentric rings being considerably softer: such timber may be said to decrease in hardness and strength in arithmetical proportion as it approaches the sap wood. Timber is felled during the cold months, when the natural juices are most inactive and the tree is in a measure dormant. But before the timber can be used, the juices must be got rid of from the capillary vessels, or the wood will remain moist or green for a considerable period, and the planks formed from it will, in a confined situation, become stained, and then subject to decay or dry rot: these effects are prevented by free exposure to dry air. It is usual in the royal dock yards to cut out the timbers for ships of the required shape and dimensions about a year before they are framed together, and the skeleton frame is usually left another year to complete the seasoning. Other mischiefs almost as fatal as decay also occur to unseasoned woods; round blocks, cut out of the entire circular stem of green wood, or the same pieces divided into quarterings, split in the direction of the medullary rays, or radially; also, though less frequently, upon the annual rings. Such of the round blocks as consist of the entire section contract pretty equally, and nearly retain their circular form, but those from the quarterings become oval from their unequal shrinking. In general, woods do not alter in any material degree in respect to length. Boards and flat pieces contract, however, in width; they warp and twist, and when they are fitted as panels into loose grooves, they shrink away from that edge which happens to be the most slightly held; but when restrained by mills, mortises, or other unyielding attachments, which do not allow them the power of contraction, they split with irresistible force, and the materials and labour thus improperly employed will render no useful service" The natural juices of the tree must be got rid of by seasoning in order that the wood may become dry and hard. After the tree has been lopped, barked, and roughly squared, it is left for some time exposed to the weather, and may be soaked in fresh running water (as some think) with advantage, or boiled or steamed. This dilutes and washes out the juices, and the more readily evaporates from the wood at a subsequent period, and the colour of white woods is said to be improved thereby. In this way, fir timber, on its arrival at the port of London, is commonly formed into floats on the Thames, and allowed to remain for some time. When removed from the water, it is left to dry thoroughly before it is taken to the pit to be sawn; usually it is blocked up from the ground so as to have a free circulation of air, and if it be cut into boards, they should be piled one on the other with billets of wood between them, or laid in a triangular form, with their ends alternating so as to allow the air to have free access to them. Thin pieces will be seasoned in about a year, but thick wood requires two or three years before it is removed into the house to complete the drying. The warm air of a stove-heated room will then act upon it with benefit. In the stacking of timber for the purpose of seasoning, the pile should be so far raised from the ground as to allow the air to circulate below, as well as around and through it; and if not sheltered from the rain, care should be taken to prevent the wet from lodging in any part. It is now usual in dockyards to have elevated supports of iron or of stone for the stacking of timber, and ships are now built under covered sheds. The drying of timber should be gradual, for if rapid, it suffers a loss in toughness as well as in pliability: the pores at and near the surface become contracted, and prevent the interior moisture from escaping. Plans for the more rapid drying of timber by means of kilns have, however, been tried, as in Price's patent, in which timber destined for building purposes is placed in a room, into the lower part of which hot and dry air is introduced, and this, charged with the moisture of the timber, is allowed to escape at the upper part. By this, timber can be seasoned in one third of the time required in the open air. Oak loses nearly two fifths of its weight by proper seasoning. The timber should be dry before it is cut into planks, or they would be liable to warp and shrink.

Decay.—The presence of air, light, and moisture seems to be necessary to the re-vegetation of timber or the growth of that fungus which leads to its destruction. Mr. Fincham of Her Majesty's dock-yard bored a hole in one of the timbers of an old ship built of oak, the wood being sound, and in 24 hours the admission of air caused the hole to be lined with a white mouldiness due to the growth of a peculiar fungus, which some time after became so compact as to admit of being withdrawn like a stick. Cracks or splits in timber would therefore predispose it to decay in damp situations by admiting the air. There are great differences in woods as to their power of resisting decay; some perish in a year or two, others are sound and even fragrant for centuries. Teak has been found to last six or seven times as long as oak when used in green houses, as boxes for growing plants, the latter wood not existing more than two or three years; but the moist atmosphere, light and heat of a greenhouse form a severe trial for any wood.

Fancy wood.—In addition to timber-trees,

a vast variety of woods are used for ornamental purposes. In a series of papers contributed by Professor Forbes to the Art Journal, on "Woods used for Ornament and Purposes of Art," some clear distinctions, definitions, and descriptions are given, which Mr. Tomlinson, with the permission of the publisher, abridged. The term wood is commonly applied to those portions of the vegetable axis that are sufficiently hard to offer considerable resistance and solidity, so as to be used for purposes requiring various degrees of firmness and strength. Every flowering plant is composed of an axis, and the appendages of the axis; the former consisting of the stem and root, the latter of the leaves and flowers. In trees, shrubs, and under-shrubs, the axis is said to be woody; in herbs it is termed herbaceous. In the former, stems are permanent, and do not die to the ground annually, as is the habit of the latter. A shrub, a tree, an undershrub, a bush, are merely gradations of magnitude in perennial plants; woods valuable for purposes of Art and Manufacture are derived from all of them. But as bulk and dimensions are necessary to make timber available for extensive use, by far the greater part of our ornamental woods are derived from trees. There are, however, some remarkable exceptions. The wood of roots is different in structure from the wood of stems, and the same tree may furnish two very different kinds of ornamental wood, according as they are derived from its ascending or its descending axis. The wood of the inner portions of a stem may be of very different colour and quality from that of its outer parts. In the immediate neighbourhood of the origin of branches, it may exhibit varieties of pattern, such as to render it greatly more ornamental than elsewhere, and in some cases, when under the influence of morbid growth, reveals additional beauties, so as to be prized for qualities which in nature are defects. If we take a number of transverse sections of wood, and compare them one with another, it will soon become evident that there are two principal types or modifications of structure. Compare a cross cutting of Teak or oak or mango with a like portion of Palmyra wood, and you will see the differences between them strongly contrasted. In the former, the layers of wood are ranged in concentric circles round the central pith, and are encased externally in a binding of bark, itself composed of distinct and differently organized portions. In the latter there is an uniform appearance throughout the section, the substance not being disposed in concentric rings, but appearing as if a bed or ground of one kind was studded with specks of another order of tissue. These are not slight dissimilarities, they indicate differences of the greatest structural importance in the economy of the respective trees. Corresponding with them are peculiar modifications of every portion of the plants organization. The external aspect of the plants of either type is altogether unlike that of the other.

The appearance styled silver-grain in wood is dependent on the cellular tissure of the medullary rays, and is, therefore, exhibited by exogenous woods only. It gives the streaks of glancing satiny lustre, that are so ornamental in many kinds of woods. In the oak and beech this appearance is conspicuous. The inner layers of wood, after the tree has become aged, often become compact, and frequently different in colour from the new wood. They are then styled the heart-wood. Botanists term them the duramen and apply the name alburnum to the outer layers or sap-wood. In the former, the tissues have become dry and dense, and charged with solidifying deposits, so as to prevent them aiding in the ascent of the sap. Often, too, they become more or less deeply coloured, so as conspicuously to contrast with pale sap-wood. This difference is especially conspicuous in the ebony-tree, the black portion of which is the duramen, or heart-wood. In the oak, they resemble ebony. Furniture of exquisite beauty has been constructed of yew-wood; indeed it is admirably adapted for fancy cabinet work, either in mass, or inlaid as veneers: the supply is said, however, to be insufficient. The wood of yew was once extensively used in Britain, in the making of bows.

The cedar is a native of the warmer temperate mountainous regions of Asia. The celebrity of the cedar of Lebanon dates from a very high antiquity; and the reputed value of its timber for ornamental and cabinet purposes, has been placed on record from very ancient times. Either, however, more coniferous trees than one have been included under the popular appellation or the qualities of the wood have sadly degenerated, for that of the existing cedar of Lebanon is by no means remarkable for beauty, durability, or sweetness of odour, all of which properties were pre-eminently ascribed to it. The tree itself is as grand as ever; one of the most majestic of arborescent elements in the landscape. It was extensively used among the ancients. Nevertheless, this wood, such as we now know it, is not one to choose for carving or house construction. It is very light and spongy, of a reddish white colour, scented like ordinary pine, and not at all durable. It is possible that other kinds of coniferous trees were confounded by the ancients with the tree cedar. The Himalayan "*deodar*," a tree very closely related to the Cedar of Lebanon, really possesses all the good qualities, for which the latter has been so long celebrated. Travellers in the East, in writing about cedars, often confound various kinds of arborescent juniper under that name.

The numerous race of pines and firs for the

most part are more useful than ornamental, so far as their timber is concerned. Some of them, however, afford wood with many desirable qualities for furniture making.

Among the natural orders that have affinities with catkin-bearing trees, are the Walnut and the Nettle tribes.

The box belongs to the spurge tribe. It produces a warm yellow wood, much used by the turner, and well adapted for the construction of flutes and similar musical instruments. It is the yellow wood which we often use in the shape of rules and scales, and it is also the chief wood employed in wood engraving. It is sometimes beautifully mottled. In Britain we have the box growing wild and luxuriant in Surrey, as at Box-hill, but the chief supply of this wood is derived from the southern parts of Europe, and from Asia Minor. A distinction is drawn between "Turkey" and "European" boxwood. The latter is more curly, softer, and paler than the former. Dr. Royle has called attention to a different species of Buxus, a native of the Himalayas, yielding a wood possessing similar qualities with that in common use, and having the advantage of being found of considerable size and thickness. The ash and the olive are members of the olive family. The former familiar tree yields a timber remarkable for toughness and elasticity, and, excellent for machine and agricultural purposes, but not much used for finer applications. When, however, the grain is zigzag, it is adapted to the making of furniture of considerable beauty. Olive-wood is imported from the Mediterranean countries. It is veined with dark grey, and resembles boxwood in texture, but is softer. The knotted and curled roots are made into embossed boxes. This is done by means of pressure in engraved moulds of metal. The Araliaceæ, a natural order to which the ivy belongs, may be mentioned here incidentally on account of the substance so well known as rice-paper. This was long supposed to be the pith of a leguminous plant; its true nature was not made known until lately, when Sir William Hooker demonstrated that it was the pith of an Araliaceous tree. A living plant had been procured with great difficulty from the Chinese, and was sent to England, but died on the passage. It was said to be exclusively a native of the island of Formosa, but Mr. Fortune found the Aralia growing in other parts, and it was introduced by him into India.

The almond-tree, especially when wild, is said to furnish a valuable wood, but which is little known or used. The great order of leguminous plants, the Pulse tribe, is rich in trees, but not much so in temperate climates, nor is there any ordinary tree of the group upon which stress can be laid. There are now eight descriptions of timber admitted by the English as first-rate for ship-building purposes, and one of these has only been so ranked since the opening of the Great Exhibition. They are :—1, English oak; 2, American live-oak; 3, African oak; 4, Morung saul; 5, East Indian teak; 6, Green heart; 7, Morra; 8, Iron-bark (the newly admitted wood). Of the above the Morung saul is an Indian tree, as well as the better known valuable Teak. The Iron-bark is from New South Wales, and has a density of 1426, and a strength of 1557, (English oak being called 1000).

Wood is very valuable as a fuel: the excess of hydrogen contained in it which, in burning and forming water, requires for equal weights three times as much oxygen as the carbon does in forming carbonic acid, gives out in burning nearly four times more heat than the carbon.—*Tomlinson.*

In all countries most of the woods in general use, have a variety of names, the *local* name varies often in the same district. Many have likewise, a *commercial* name, by which they are known in the Market, as "Trincomallee" wood, "Coromandel" wood &c. These names are sometimes given from the place of export, but often it is impossible to trace their derivafion. Lastly, there is the *Botanical* name, the sure determination of which is a matter of the first importance, and the means of doing this consists of a small shoot, bearing flowers, fruit and full grown leaves, either together or separately, pressed flat and dried, so as to be fixed on a sheet of paper.

Size, &c. of the Specimens.—For a complete collection, there should be several of each wood from various localities. 1st, A horizontal section of the tree with the bark complete, and about 3 inches thick. 2d, A plank about 3 inches thick and about three feet long, cut from the log about half way between the pith and heart, the bark, sapwood, &c. being retained. 3d. Two or three bars about 2 feet 6 inches long, 2¼ inches square (if the plant grows so much) cut from the sound wood. 4th. A turned cylinder of hard or ornamental woods, 1 foot long and 3 inches in diameter.

The value of wood depends much on its age, the young tree possesses strength and elasticity in a greater degree than mature, i. e. when it would shortly cease to increase in diameter; as it increases in age it acquires its maximum of stiffness and durability, in its aged state, it will probably best suit the purposes of the Cabinet Maker. The grain of the wood depends greatly on the nature of the soil, being generally straight and open in a tree growing rapidly, in a rich, and the reverse in a poor soil. In some cases, the root affords wood of great resisting power for furniture, the root of a healthy Oak is prepared for spokes of wheels, and veneers from that of an aged specimen, often bear a high value for Cabinet makers purposes. In collecting specimens of the characters of wood there are points to which attention should be directed. viz:

a. The uses to which the several parts of the tree is applied, and those for which experienced Natives consider it specially adapted.

b. Its distribution in the District, the localities where the best is procurable with the nature of the subsoil, the distance from the nearest seaport, or town of any size : whether water carriage be available ?

c. The extent of supply, whether this is increasing by self sown seedlings of fresh plantations, &c. or decreasing? the average size in height and circumference of the native tree, its character, whether straight or crooked, the average length, &c. of the logs or planks, the times required for seasoning, and the amount of seasoned timber generally procurable.

d. The age at which the tree reaches maturity, i. e. when increasing age brings no further increase of diameter. This is a point of great importance, for on it depends the relative value of trees for planting. Thus, supposing there are two species of trees, of equal value as regards timber, &c., but one attains maturity in 25, while the other requires 35 years, it is obvious that the first is much the more valuable of the two : its money value being realised 10 years sooner.

The following is a List of Woods authorized to be used as Railway sleepers, and, in 1855, under trial on the Madras Line.

1—Teak.....Tectona grandis.
2—Saul.....Vatica robusta.
3—Sissoo.....Dalbergia sissoo.
4—Pedawk.....Pterocarpus Indicus.
5—Kurkuttah.....Zizyphus glabrata.
6—Kurrah Murdah...Terminalia glabra.
7—Maroothy Marum Terminalia alata.
8—Aucha Marum.....Bauhinia diphylla.
9—Vangay Marum...Pterocarpus marsupium.
10—Kadookay Marum Terminalia chebula.
11—Neenee Marum.....
12—Myladee Marum.....
13—Sem Marum.....Soymida Febrifuga.
14—Curroo Vangay or Chella Woongah Marum } Acacia odoratissima.
15—Perumbay Marum....Prosopis spicigera,
16—Erroovaloo Marum...Inga Xylocarpa.
17—VelVangay Marum...Acacia speciosa.
18—Peela Marum.. ... ..Artocarpus integrifolia.
19—Dud Eloopa Marum Bassia longifolia.
20—Karvalum Marum....Acacia arabica.
21—Combadree.....
22—Katoovoye Marum...

From the various sources of information at command, the following list contains the names of the principal trees which are felled for Timber or Fancy woods throughout the various countries in India and in Eastern and Southern Asia.

Acacia amara, Nulla balasoo, *Tel.* Woonja marm, *Tam.*

Acacia Arabica, Curvala, *Tam.* Tuma, *Tel.* Babool, *Hind.*

Acacia catechu, Wodahalay, *Tam.* Sha, also Kwonthee, also Sha-bin, *Burm.*

Acacia cinerea.

Acacia elata, Seet, *Burm.* Tella sopara, *Tel.*

Acacia ferruginea, Ausandra, *Tel.*

Acacia Halkora, Dulchirram, *Tel.*

Acacia leucophlea, Velvaila, *Tam.* Tella tuma, *Tel.*

Acacia odoratissima, Caroovangay, *Tam.* Telsoo, also Shinduga, *Tel.*

Acacia Serissa, Seet, *Burm.*

Acacia Smithiana.

Acacia speciosa, Velvangay, *Tam.* Ped dulchirram, also Dirasa, *Tel.*

Acacia stipulata, Seet, *Burm.*

Acacia suma, Tella Sundra, *Tel.*

Acacia sundra, Currangally, *Tam.* Nulla sundra, *Tel.*

Acacia vera. Andere, *Cyng.*

Adansonia digitata, Papara poolimarum, *Tam.*

Adenanthera pavonina, Kwæ-gyee, also Y-wai-gyee, *Burm.*

Ægle marmelos, Vilvay marum, *Tam*, Oo-Sheet, *Burm.* Maredu, *Tel.* Bael, *Hind.*

Agati grandiflora, Agathy, *Tam.* Pouk-ban, *Burm.*

Agathis loranthifolia.

Aglaia spectabilis.

Ailanthus excelsa, Peru marum *Tam.*

Alangium decapetalum, Alinjee marum, *Tam*, Udugu *Tel.*

Alstonia scholaris, Kori, also Kowun, *Can.* Satween *Mahr.*

Anacardium occidentale, Moontheree Cotty marum *Tam.* Thub-bam-bu, *Burm.* Jidi mamidi, *Tel.*

Anacardium latifolium, at Goalpara. Bheela, *Hind.*

Ancestrolobus carnea. Zoung ali, *Burm.*

Ancestrolobus mollis. yin-bya, *Burm.*

Andrachne apetala.

Anissaphyllum Zeylanicum, Welippiyenna, *Cyng.*

Anogeissus acuminatus. Paussee, also Panchee. *Tel.*

Anogeissus latifolius. Sheriman, *Tel.*

Aponogeton crispum, cocatiye, *Cyng.*

Aquilaria agallocha, Aglay marum. *Tam.* A-Kyau, *Burm.*

Amoora (Aglaia) rohitaca, kha-you also kha-yo, *Burm.*

Antidesma paniculata, By-it-zin, *Burm.* Jana palseru, *Tel.*

Areca catechu, Camoogoo. *Tam.*

Armosia dasycarpa. Thit-wa-jee *Burm.*

Artocarpus integrifolia Peing-nai, *Burm.*

Artocarpus echinata, Toung Peingnai, *Burm.*

Artocarpus hirsuta, Angelly wood.

Artocarpus pubescens, Aludel, *Cyng.*

Artocarpus chaplasha.

Artocarpus *species* of Tavoy. Pyn-ya-the, also Tana-beng, *Burm.*

Artocarpus sylvestris, Row funnus, *Mahr.*

Atalantia monophylla, Cdatyaloo micha marum. *Tam.*

Averrhoa carambola. Zoung-ya, *Burm.*

Azadirachta indica Margosa, Neem Tree; Vaypum marum. *Tam.* Neem ka jhar, *Hind.* Ka-ma-a-pae, also Them-ba. also Kamakah, *Burm.* Yepa, also Yapa, *Tel.*

Bambusa, Bamboo. Baus, *Hind.*

Barringtonia acutangula, Kyai-tha, *Burm.*

Barringtonia speciosa. Kyai-gyee, *Burm.*

Bassia latifolia.

Bassia longifolia. Elooppa marum, *Tam.* Mee, *Cyng.* Ippee, *Tel.*

Bauhinea brachycarpa. Bwai-jin, *Burm.*

Bauhinea parviflora. do.

Bauhinea, *Species.* Pul.i-Shinta, *Tel.*

Bauhinea racemosa. Arree, *Tel.*

Bauhinea diphylla. Pa-lau, *Burm.*

Bauhinea tomentosa. Petan, *Cyng.*

Betula bhojputra.

Berrya ammonilla, Trincomallee wood, *Eng.* Halmilile, *Cyng.*

Bignonia *Species.* Kala-goru also Chinna kala-Goru, also Mokka yepa, *Tel.*

Bignonia chelonoides, Kala-Goru, *Tel.*

Bignonia suaveolens, do. *Tel.*

Bignonia quadrilocularis, Wursus, *Mahr.*

Bignonia xylocarpa.

Blackwellia spirale.

Blackwellia perpinqua.

Borassus flabelliformis. Palmyrah tree, *Eng.* Htan, *Burm.* Tal, *Cyng.*

Boswellia thurifera.

Briedelia montana. Goonjan murral, *Can.* Assuna, *Mahr.*

Briedelia spinosa.

Bruguiera Rheedii.

Butea frondosa. Pouk also Pouk-pin, *Burm.* Calukeale, *Cyng.* Motku also Modugu, *Tel.*

Buxus, Box.

Calamus, Canes, Ratans. Kyeing-nee, *Burm.* Bade, *Hind.*

Calophyllum longifolium, Thar-ra-bee, *Burm.*

Calophyllum acuminatum, wal-dombe, *Cyng.*

Calophyllum calaba, Gorru-keence, *Cyng.*

Calysaccion angustifolium.

Calyptranthes cummini, Mahadan, *Cyng.*

Calyptranthes cariophyllifolia, Batte dombe, *Cyng.*

Calyptranthes jambolana, Alubo, *Cyng.*

Cannarium geniculatum.

Canthium didymum, Nulla regoo, *Tel.*

Canthium parviflorum. Balsu, *Tel.*

Capparis grandis, Reygutti, *Tel.*

Carapa, *species*, Tai-la- oon, *Burm.* of Tavoy.

Careya arborea, Ban-bwæ, or Baub-wai, *Burm.* Buda-darinee, *Tel.*

Carallia zeylanica, Davette, *Cyng.*

Caryota urens, Kittul, also Nepera, *Cyng.*

Carrallia lucida, Keerpa, *Beng.*

Cassia florida.

Cassia nodosa.

Cassia sumatrana, Arramene, *Cyng.* Mayalee, *Burm.*

Casearia pentandra, Tha-byai-ywet-kya, *Burm.* Kahatte, *Cyng.*

Casearia, *Species.* Peda kal mesura, *Tel.*

Cassia cinnamomum, Dawol Kuroendoo, *Cyng.*

Castanea indica, Theet-Khaya. *Burm.*

Castanea martabanica of Tavoy, Norne or Zitha, *Burm.*

Casuarina equisitifolia.

Casuarina muricata, Beef-wood tree, *Eng.* Hten-roo, *Burm.*

Cæsalpinia Sappan, Teing-nyet, *Burm.*

Cathartocarpus Roxburghii, Uskiaman, also Uri-widdee, *Tel*

Cedrela toona, Toon marum, *Tam.* Thit-kado, *Burm.* Toon, Tunga, Poma, Jeea.

Cedrus deodara, the deodar, *Eng.* Kelon, *Hind.*

Chaulmoogra odorata.

Chickrassa tabularis, Aglay marum, *Tam.*

Choecarpus pungens, Hedde woke, *Cyng.*

Cicca disticha, Nelly, *Cyng.*

Cluytia amona.

Cluytia collina, Woadoogoo marum, *Tam.* Koorseya also koorse, *Tel.*

Cocos nucifera, Tenna marum, *Tam.* Cocoanut, *Eng.* Narel ka jhar, *Hind.*

Connarus speciosa, Gwai-douk, *Burm.*

Conocarpus latifolia.

Conocarpus robusta, Bai-byah, *Burm.*

Cordia, *new species.* Botku, *Tel.*

Cordia angustifolia, Chinna Botku, *Tel.*

Cordia myxa, Tha-nat, *Burm.* Irkee also Peda botku, *Tel.*

Cratæva Roxburghii, Ka-dat, *Burm.*

Cupressus torulosa, Cypress.

Cynometra polyandra of Nepaul.

Cynometra, *Species*: Branch flowered, Halmendora, also Galmendora, *Cyng.*

Cyrtophyllum fragrans.

Dalbergia frondosa, Yindike, *Burm.* Peda soopara also yerra patseroo, *Tel.*

Dalbergia lanceolaria, Nedoon or Nander wood, or Nendoon. *Cyng.*

Dalbergia latifolia. Eroopoottoo, *Tam.* Yindike, *Burm.* Jitigee, also yerroo goodoo, *Tel.*

Dalbergia sissoides, Bitty marum, *Tam.* Yindike, *Burm.*

Dalbergia sissoo, Sissoo, *Tam.* Yindike, *Burm.*

Dalbergia Oojeinensis.

Dillenia augusta, Zinbyewn, *Burm.*

Dillenia scabra, Byew, *Burm.*

Dillenia speciosa, Tha-byew, *Burm.* Peda kalinga, *Tel.*

Dillenia pentagyna, Chinna-kalinga, *Tel.*

Diospyros syhrtica, Nulla kaka mushti, *Tel.*

Diospyros chloroxylon, Ulinda also Yelinda, *Tel.*

Diospyros melanoxylon.

Diospyros racemosa.
Dipterocarpus alatus, Aing, *Burm.*
Dipterocarpus grandiflora, Ain or Ain-tha or Kun-nyau-phin, *Burm.*
Dipterocarpus turbinatns, Horre, *Cyng.* Kan-yeen, *Burm.*
Dodonea viscosa.
Dolichampia pomifera, Douk-ya-ma, *Burm.*
Diospyros hirsuta, Calamander or Coromandel, Calu Medirye, *Cyng.*
Diospyros ebenaster, Ebony, Kudum Berye, *Cyng.*
Diospyros melanoxylon, Ebony, Ouk-chin-ya, *Burm.*
Diospyros, *Species.* Muchi twikee, also Wurungul, *Tel.*
Dombeya melanoxylon, St. Helena Ebony.

Echites lanceæfolia, kiri wala, *Cyng.*
Echites scholaris, Rook attene, *Cyng.*
Ehretia lœvis, Yen-yai-myouk-myee, *Burm.* Pal dautum, *Tel.*
Ekebergia, *species* of Goalpara.
Eleocarpus serratus of Ceylon.
Emblica officinalis, *Usarka, Tel.*
Elæodendron integrifolia, Jouk bin, *Burm.*
Embryopteris glutinifera, Timbery, *Cyng.*
Eriochlæna Hookeriana, Nara Botku, *Tel.*
Eriochlæna tilifolia
Eriobotra Japonica.
Erythrina Indica.
Euphorbia tirucalli, Munchee jamudu, *Tel.*
Eugenia pulchella, Khway-tha-byai, *Burm.*
Eugenia myrtifolia, Tha-bai-jeen, *Burm.*
Eugenia caryophyllifolium.
Eugenia mallaccensis.
Eugenia jambolona.
Eugenia nervosa.
Eugenia ternifolia, Thab-yew-tha-byai, *Burm.*
Eugenia pulchella.
Eugenia racemosa.
Eugenia vulgaris, Thab-yai-tha-pan, *Burm.*
Eugenia salicifolia
Eugenia laurina. Wall-boam-boo, *Cyng.*
Execaria agallocha, Agallocha wood.

Fagrœa fragrans. A-nan, also Anan-Beng. *Burm.*
Feronia elephantum, Vella marum. *Tam.* H-man, *Burm.*
Ficus cordifolia. Nyoung-gyat, *Burm.*
Ficus indica. Banyan Tree. Bar-ka-jhar, *Hind. Tam.* Marree, *Tel.*
Flacourtia sapida. Kanuregu, *Tel.*
Flacourtia montana. Sampga, *Can.* Tambut. also Hudkee.

Garcinia Cowa.
Garcinia purpurea, Moorghul mara, *Can.* Kokum, *Mahr.*
Gardenia gummifera, Chitla matta. *Tel.*
Gardenia latifolia, Peda karinga, *Tel.*
Gardenia lucida. Garinda, also Tella Manga, *Tel.*
Gardenia, *Species.* Telega, *Tel.*
Geloxium bifarium, Hsai-than-bayah, *Burm.*
Gmelinia arborea, Coormmy marum, *Tam.* Kyoon-boe, *Burm* Goomar tek, *Tel.*
Gordonia floribunda, Theet-ya, *Burm.*
Gordonia integrifolia.
Guaiacum officinale, *Tam.*
Guatteria longifolia.
Guettardia speciosa,
Grewia floribunda. Myat ya, *Burm.*
Grewia Hookerii. Phet-woon, *Burm.*
Grewia Rothii, Jana, *Tel.*
Grewia spectablis, Phet woon, *Burm.*
Grewia tiliæfolia, Tharra, *Tel.*
Grewia paniculata, Hunu kirille, *Cyng.*
Gyrocarpus Jacquini, Poonkee, *Tel.*
Givotia Rottleriformis, Tella poonkee, *Tel.*

Hæmatoxylon campechianum. Logwood.
Hardwickia binata. Nar yepa, *Tel.*
Heritiera fomes : Soondree.
Heritiera litoralis, Kana zoe, *Burm.*
Heritiera minor, Soondree, *Hind.* Kana-zoe, *Burm.*
Hibiscus macrophylla.
Hibiscus tiliœfolia, Belygobel, *Cyng.*
Holugarna longifolia, Holgen, *Can.*
Hopea odorata. Then-gan, also Then-gan-pha-yung, *Burm.*
Hopea floribunda. Than-the-ya, *Burm.*
Hymenodictyon excelsum, Dudippa also chetippa, *Tel.*

Indigofera, *Species.* Doun-Daloon, *Burm.*
Illecebrum latrum, Nerrelloo, *Cyng.*
Inga dulcis, Coorkapooli marum, *Tam.*
Inga xylocarpa, Iron wood of Pegu, Py-in-ka-doe, *Burm.* Boja also Konda Tangadu, *Tel.*
Inga bijemina, Tau-yew, *Burm.*
Ixora parviflora, Koree, also Koravee Pal. *Tel.*

Jonesia asoca. Deree-ratem-bela, *Cyng.*
Juglans tricocca. Ta-soung-let-wah. *Burm.*
Juniperus excelsa, Cedar of the Himalayas.

Kydia calycinia. Boke-mai-za, *Burm.*

Lagerstræmia microcarpa.
Lagerstræmia reginæ, Jarool. *Hind.* Murute, *Cyng.*
Lagerstræmia Pymmah. Pymmah, *Burm.*
Lagerstræmia parviflora, Chinna ngee, *Tel.*
Laurus camphora, camphor-wood,
Laurus (sassafras). Hman-Then, *Burm.*
Lawsonia inermis. Marooithanay marum, *Tam.* Dan. *Burm.*
Limonia acidissima. Torelaga, *Tel.*

Maba buxifolia, Nulla muddee, *Tel.*
Mangifera attenuata, Taw-sa-tha-yeet, *Burm.*
Mangifera Indica, Maah marum, *Tam.* Tha-yet, *Burm.* Mango tree, *Eng.* Mamadi, *Tel.*
Melanorrhæa usitata, Varnish tree, *Eng.* Ma-yan, also Theet-see, *Burm.*

Melia azadirachta, Malay Vaimboo, *Tam.* Persian Lilac; Pride of China; Pride of India, Bead tree, *Eng.*
Melicocca trijuga, Jo-bin, *Burm.*
Memecylon tinctorium, Surpa, *Mahr.* Iron wood of Canara.
Mesua ferrea, Singalese Iron wood tree, *Eng.* Naga keshura, *Burm.* Naw, *Cyng.*
Metrosideros vera, Iron wood of China.
Michelia Rheedii, Sumpanghy marum, *Tam.*
Michelia champa, Sappoo, *Cyng.*
Millingtonia simplicifolia.
Mimosa polystachia.
Mimusops elengi, Maghudam marum, *Tam.* also Kha-ya-gang, *Burm.* Moone mal, *Cyng.*
Mimusops hexandra. Paloo, *Cyng.*
Morinda citrifolia, Noanay marum, *Tam.* Nyaugyee, *Burm.*
Morinda bracteata, Yai-yoe. *Burm.*
Morinda excerta, Nyau also Mhan-bin, *Burm.* Togaree Mogillee also Mogillee, *Tel.*
Murraya.
Myristica amygadalina, Toung-sag-ga, *Burm.*
Myristica sphærocarpa, Kywai-thwæ, *Burm.*
Myrsine capitellata.

Nauclea cadamba, Vella cadamba, *Tam.* Maoo, *Burm.*
Nauclea cordifolia, Munja cadamba, *Tam.* Puspoo carambe also Bundaroo, *Tel.*
Nauclea orientalis, Kuta murra, *Can.* Kudum, *Mahr.*
Nauclea parviflora, *Helembe, Cyng.*
Nerium andysentericum.
Nerium tinctorium.
Nepheleum, *species* gal morre, *Cyng.*
Nyctanthes arbor tristis. Tree of Mourning. Hseik-ba-la, *Burm.* kar-cheea, *Tel.*

Odina wodier, Oodaya marum. *Tam.* Dumparee, also Goompinee, *Tel.*
Olax zeylanica, Melle, *Cyng.*

Parkia biglobosa,
Pentapterus alata, Kendul, *Can.* Kinjul, *Mahr.*
Pentapterus arjuan, Touk-kyan, *Burm.*
Pentapterus coriacea, Mairtee, *Can.* Aeen, *Mahr.*
Pentapterus glabra, Touk-kyan, *Burm.*
Pentapterus tomentosa.
Photinia serratifolia.
Pierardia sapota, Kana-yoe, *Burm.*
Pinus dammara of Tavoy.
Pinus Latteri, Hten-roo, *Burm.*
Pinus longifolia, of Nepal.
Pinus Webbiana of Nepal.
Poinciana elata.
Poinciana regia.
Pongamia atropurpurea, Lagun, *Malay,* of Martaban.
Pongamia glabra, Poonga marum, *Tam.* Karung. *Cyng.* Kanigu, *Tel.*
Premna hircina, chika gambhari, of Goalpara.
Premna tomentosa, Kolcuttay Teak, *Tam.* Naoo ru also Nagool, *Tel.*
Prosopis spicigera, Parumbay, *Tam.*
Psidium pyriferum, Coaya marum, *Tam.* Ma-la ka, *Burm.* Guava Tree, *Eng.* Jam ki jhar, *Hind.*
Psidium pomiferum, Coaya marum, *Tam.* Ma-la ka, *Burm.* Guava Tree, *Eng.* Jam ka jhar, *Hind.*
Pterocarpus dalbergioides.
Pterocarpus indicus, "Pa-douk." Toung khayai, *Burm.*
Pterocarpus marsupium, Vengay marum, *Tam.* Yeggee, *Tel.*
Pterocarpus santalinus, Sevapoo Sandanum, *Tam.* Chandum, *Tel.* Red sanders wood, *Eng.*
Pterocarpus Wallichii.
Pterospermum, Indicum "Kyabooca."
Pterospermum aceroides, Tha-ma-jam-wai-zoke, *Burm.*
Pterospermum acerifolium, Na-jee, *Burm.*
Pterospermum subacerifolium, Na-jee, *Burm.*
Pterospermum ruberifolium, Velengee, *Cyng.*
Putranjiva Roxburghii.
Pygium acuminatum.

Quercus-Oak, many species. Tha-heik, also Thae-gha, *Burm.*
Quercus amherstiana.
Quercus Tirbbæ.
Quercus fenestrata.
Quercus lanceæfolia.
Quercus semecarpifolia Ghese cusroo.

Randea, *species.* Nulla mauga, *Tel.*
Rhododendron arboreum.
Rhus disipium, Pehim-bive, *Cyng.*
Rhyzophora decandra.
Rhyzophora gymnorrhiza. Pyu, *Burm.* Mangrove.
Ricinus dicoca. Taw-the-din-bin, *Burm.*
Rondeletea tinctoria. Tama-yoke, *Burm.*
Rottlera tetracocca. Kioun-la, *Burm.*
Rottlera tinctoria, Kioun-la, *Burm.*

Salmalia malabarica, Poola marum, *Tam.*
Sandoricum indicum, Theet-to, *Burm.*
Sapindus acuminata.
Santalum album, Shandanum marum, *Tam.* Sanda-koo, *Burm.*
Sapindus emarginatus, Poocheecotay marum, *Tam.* Hseik-khyae, *Burm.* Kankadu, *Tel.*
Sapindus rubiginosa, Hseik-khyæ, *Burm.*
Sapota elegenoides.
Scytalea longa.
Scytalea trijuga.
Semecarpus anacardium, Chai-bin, *Burm.*
Sethia indica, Dewi-daree, *Tel.*
Schleichera trijuga, Kyet-mouk, *Burm.* Poosku, *Tel.*

TIMBER AND FANCY-WOODS OF EASTERN AND SOUTHERN ASIA.

Dr. Wallich is the only other author we shall quote on the subject of the woods of Asia generally, and we give his Catalogue here as furnishing places of growth, the weight per cubic foot nd specific gravity of the principal of the woods of which we have already given the list.

NAME.	Place of growth.	Weight per cubic foot. lbs.	oz.	Specific gravity	REMARKS.
1 Acacia—? (Popeeah),	Tavoy,	23	3	.371	A large tree; wood used in house-building, &c.
2 „ „	do.	23	3	.371	A very large tree; wood used for posts, bows, and rollers and for cotton gins.
3 Ægle marmelos (Bellee),	Ceylon, India,	49	1	.784	
4 Anacardium latifolium (Bhela)	Gualpara,	37	0	.592	Used for making chests and couches.
5 Andrachne apetala,	India,	33	14	.542	
6 Artocarpus chaplasha,	India,	34	12	.556	
7 Artocarpus hirsuta (Angellywood),	Cochin,	36	14	.590	Used in ship-building.
8 Artocarpus integrifolia (Jackwood)	Travancore,	35	10	.570	
9 Artocarpus—? (Pynyathe Tanabeng)	Tavoy,				
10 Aultoovanchee,	Travancore,	31	6	.502	
11 Auyanny,	do.	32	11	.523	
12 Averrhoa carambola,	India,	39	11	.635	
13 Bah-nah-thoa	Tavoy,				Used in boat and house-buildings.
14 Betula Bhojpattra,	Nepal,	35	5	.565	Wood moderately hard, compact.
15 Bignonia chelonoides,	Nepal.	42	8	.680	A large tree.
16 Bignonia—? (Tathee),	Tavoy,	49	8	.792	A very large tree.
17 Bignonia (Thuggainee),	Tavoy,	40	4	.644	A large tree, used in house-building.
18 Cadooca Marum,	Travancore,	38	3	.611	
19 Calophyllum—? (Thurappe : chopee),	Martaban,	43	0	.688	Used for masts and spars, and for pestles to oil presses.
20 Cambagum,	Travancore,	28	11	.459	
21 Canoo,		36	0	.576	
22 Cannal	Travancore,	47	6	.758	
23 Cannao,	do.	58	7	.935	
24 Caragagaloo,	do.	33	0	.528	
25 Carapa—? (Tai-la-oon),	Tavoy,	36	0	.576	Used in house-building.
26 Careya—? (Kaza),	Martaban,	46	0	.736	Timber of large size, used for posts, &c.
27 Careya (Kombo),	Gualpara,	42	12	.684	Wood hard and strong; used for the stocks of matchlocks.
28 Caringosha,	Travancore	45	5	.725	
29 Carivagah,	do.	33	10	.538	
30 Caroogha,	do.	44	10	.714	
31 Caroo Marum,	do.	47	11	.763	
32 Carintha,	do.	34	4	.548	
33 Cassia,	India,	41	9	.661	
34 Castanea indica,	India,	39	0	.624	
35 Castanea tribuloides (Cotoor; chisee, Makoo; shingali),	Nepal,	62	0	.992	Used for pestles
36 Catunguin	Manilla,	42	11	.683	Used in

NAME.	Place of growth.	Weight per cubic foot. lb.	oz.	Specific gravity.	REMARKS.
38 Cedar,	India	25	2	.402	
39 Cedrela Toona (Toon, Tunga, Poma Jeea)	Gualpara,	36	0	.576	Wood very durable, and much used for furniture.
40 Cedrela Toona (Toon, Tunga, Poma Jeea),	India,	32	9	.521	
41 Chambagum,	Travancore,	37	11	.603	
42 Chana,	do.	20	7	.327	
43 Chinchona gratissima (Tungnusi)	Nepal	23	0	.368	Used for posts and rafters.
44 Chorangaree,	Travancore,	29	11	.475	
45 Cæsalpinea sapan (sappan),	do.	60	14	.974	Used for dyeing and sometimes by the turner.
46 Coombool,	Travancore	31	14	.510	
47 Coturnba,	Ceylon,	23	5	.373	Occasionally used in house building in Ceylon, but not esteemed.
48 Cou-moo	Tavoy,				Used in boat and house-building.
49 Cynometra polyandra	India,	52	10	.842	
50 Cynometra—? (Maingya),	Martaban,	48	7	.775	A small tree.
51 Dalbergia lanceolaria (Neddoon, Neddum, Nander-wood	Ceylon,	45	7	.727	Used and valued for house building in Ceylon.
52 Dalbergia latifolia (East India ebony)	India,	66	8	1064	
53 Debool,	Ceylon,	38	3	.615	
54 Diospyros melanoxylon (black ebony)	...	61	2	.978	Used for turnery work, and for inlaying.
55 Diospyros racemosa	India,	34	11	.555	
56 Diospyros—? (Ryamucha choomullo)	Martaban,	50	3	.803	Used in house-building.
57 Dipterocarpus—? (Kunneanphew,	Tavoy,	25	3	.403	Grows to a great size; used for beams and planks.
58 Domba,	Ceylon,	33	3	.531	Used for the outriggers of canoes.
59 Dombeya melanoxylon (St. Helena-ebony),	St. Helena,	71	9	1.145	
60 East India ebony. See Dalbergia.					
61 East India rosewood,	India				
62 Ehretia lœvis,	Botanic Garden, Calcutta.				
63 Ekebergia—? (Jiyakohi)	Gualpara,	39	1	.625	
64 Eleocarpus serratus (Weraloo),	Ceylon,	33	8	.536	
65 Eribotrya japonica (Loquat)	India,	46	11	.747	
66 Eugenia malaccensis (Jamboo),	Ceylon,	30	4	.484	
67 Eugenia malaccensis (Jamboo)	Ceylon,	30	14	.494	
68 Excœcaria	Tavoy,				
69 Fagrœa fragrans (Annah beng, Burm.	Martaban	52	8	.840	Timber large compact, very hard.
70 Ficus—? (Thubboo)	Tavoy,	21	0	.336	Used in house carpentry.
71 Gadeboo	Ceylon	21	3	.339	Used for making charcoal for gunpowder.
72 Galloopah	Travancore,	53	0	.848	
73 Garcinia—? (Pullowa)	Tavoy	45	8	.728	A large tree, used for posts.
74 Garcinia—? (Purrah wah)	do.	45	8	.726	A strong durable wood.
75 Gmelina arborea	India,	32	3	.515	
76 do. do.	do.	32	6	.516	
77 Go-na	Ceylon,	24	8	.392	
78 Gordonia—? (kaza)	Martaban	37	10	.602	Large timber, used for ordinary building purposes.
79 Guacua	India	41	14	.670	
80	...				
81 Gundruey	India,	34	15	.559	Wood with a peculiar odour resembling that of aniseed.
82 Heritiera—? (Soondree)	India,	57	15	.927	Used in ship-building.
„ „ „	do.	49	15	.799	

NAME.	Place of growth	Weight per cubic foot.		Specific gravity.	REMARKS.
		lb.	oz.		
83 Hibiscus macrophyllus	Tavoy	27	13	.445	A middle-sized tree, used for common building purposes.
84 Hibiscus macrophyllus	do.	28	0	.448	
85 Hibiscus	Tavoy,	,,		,,	Used for common building purposes; the bark is made into cordage.
86 Hopea floribunda (Tantheya)	do.	27	11	.443	A very large tree.
87 Hopea odorata (Tengaun, Thacu gong)	Martaban,	38	0	.608	Canoes are made of this tree which produces a valuable resin.
88 do. do. do.	Tenasserim Coast	40	12	.652	Used in boat building, grows to a large size, and is abundant.
89 Hune,	Burmah,				
90 Indian Wood	do.	45	6	.726	
91 Jeenh,	India,	36	11	.587	
92 Juglans pterococca,	India,	39	14	.638	
93 Juniperus excelsa (cedar of Himalaya		34	7	.551	An excellent light wood.
94 Kaantha,	Tavoy,				Small but valuable timber.
95 Kain-tha-phogee. See Symplocos,					
96 Kaunzo-kurro,	Tavoy,	43	0	.688	Used in boat-building.
97 Kaza. See Careya also Gordonia,					
98 Kealnaun,	Tavoy,				
99 Keaza Perroun,	Tavoy,				Used in house building.
100 Kuddoot-alain,	Tavoy,	53	3	.851	Grows to a great size; used in house-building.
101 Kuddoot-nee,	Tavoy,	34	0	.554	An inferior wood; used in boat building.
do. do.	do.	34	3	.547	
102 Kunneen-keunkee. See Bignonia,	do.

In our previous observations on Timber trees generally, we endeavoured to supply the names by which they are known to scientific men, but in much of the subsequent remarks attention will be directed to the woods of particular districts and the local names by which they are known.

(8193) *Timber from the province of Amherst, at the Great Exhibition of* 1851. See *Ill. Cat. Vol.* II, *p.* 885.

1 *Anan.* Used for constructing temples. It is a yellowish-white heavy durable wood.

2 *Ban-boay.* It is a strong and useful wood, a kind of Mimosa, employed as house posts.

3 *Ban-kha.* Used for house posts, and other common purposes. It is a peculiar kind of wood, colour grey.

4 *Bep-than.* Used for making handles for spears and sword; it is a superior wood, and looks like white Jarrool.

5 *Bhai-bya.* Used for house posts. White Jarrool.

6 *Bhyeng-tseng.* This is a closegrained, compact, grey wood, fit for general purposes, and seems to be exempt from attacks of insects.

7 *Bijion.* This is used for house posts, rafters, and the like purposes; it is a heavy, compact, grey, close-grained wood.

8 *Daup-yat.* Employed for rafters; it is a beautiful yellowish-white compact wood, but has a tendency to split. The leaves are used asa dye.

9 *Dien-neeung.* Used for rice-pounders; it is a close-grained, strong, compact, brown, hard wood.

10 *Eng.* Wood used for boat-building, and produces oil. It is a strong, heavy, useful, grey wood, suited for beams, piles, and the like.

11 *Eng-gyeng.* Also used for posts of religious buildings. A useful wood, but subject to split.

12 *Gan-gan.* A very strong, tough, hard, crooked grained, fibrous, red wood, which would do for machinery or any purpose requiring the above properties.

13 *Gyo.* Used for house posts, ploughs, handspikes, &c.; it is a close-grained, compact, fine wood.

14 *Ka-theet-nee.* Employed for house posts, boats, and carts. It is a heavy, hard, grey wood, rather liable to injury from insects.

15 *Kha-boung.* A strong wood but small, as strong as oak. The fruit is said to be used for rubbing on buffaloes to keep off flies.

16 *Kiep-dep*, ditto, a kind of Saul.

17 *Kiep-maup.* Employed for cartwheel spokes. Superior wood, free from attacksof insects; the tree is said to have an edible fruit.

18 *Kiep-yo.* A heavy, good wood, but small, used for house posts and rafters.

19 *Koup-ha.* This is a light, soft wood, not subject to injury from insects. It is probably Nauclea cadamba, and is employed for carved images.

20 *Kya-nan.* This is a most hard, close-grained, ebenaceous wood, of dark red colour; used for house posts, musket-stocks, and pear-handles.

21 *Kya-zoo.* This is a very heavy wood, like Saul.

22 *Kyway-thoay.* Is a strong, solid wood, probably will prove to be a kind of Acacia. Used for house posts and rafters.

23 *Kywon.* A kind of Teak wood.

24 *Kywon-bo.* This is used for house-posts, rafters, and oars; it is probably a sort of Teak.

25 *Kywon-gaung-noay.* A close, heavy, compact, tough, yellowish-white wood, of which house posts and rafters, &c. are made.

26 *Lammay* Used for house posts; it

is a red, light, but useful timber, like sandal wood, and is free from attacks of insects.

27 *La-phyan.* A heavy, solid, large-sized timber, but rather liable to injury from a peculiar insect, not white ants.

28 *Lep-dwat.* Used for spear-handles and sword-sheaths; it is a fine grained, white wood, fit for turning purposes and picture-frames; it is probably the same kind of Nauclea which is used for similar purposes in Bengal.

29 *Lieun.* Used for house posts and rafters. It is a most valuable compact wood, homogeneous and very heavy, of deep-brown colour and fine grain, and also exempt from attacks of insects.

30 *Liep-yo.* Used for making carpenter's tools; it is a very compact and heavy, but small-sized timber.

31 *Mala-ka.* This is used for gunstocks and carpenter's tools; it is a close, compact, but small-sized wood, fit for hand-spikes, wheel-spokes, and the like.

32 *Ma-thloa.* Used for house posts; probably Artocarpus integrifolius, or jack-wood.

33 *Maza-neng* or *Maga-neng.* This is a close-grained wood, nearly allied to Teak. It is used for house posts, carts, boats, paddles, oars &c.

34 *Meet-gnyoo*, or *Neet-gnyoo.* Fruit tree. It is a red-coloured, useful, strong, heavy wood, probably a species of Mimosa.

35 *Meng-ba*, or *Ming-ba.* Used for house posts and rafters. The wood looks like a kind of saul, and would answer all the purposes of that wood.

36 *Moma-kha*, or *Morna-kha.* Employed for gunstocks; it is a reddish, softish wood, close and compact, fit for turning purposes, and exempt from attacks of insects.

37 *Mou-tha-ma.* Bark used for blue dye, a fine-grained, compact, red wood, but liable to split; it would answer for hand-spikes. It resembles Myrtus pimenta.

38 *Myaup-loaut.* Cedrela; a kind of superior Toon.

39 *Myaun-ngo.* White sissoo; used for rafters.

40 *Mya-ya.* Hard and close-grained wood, used for rafters; it is strong and durable, and would answer for beams, &c., being exempt from the attacks of insects.

41 *Na-kyeen.* Employed for house posts and rafters. This is the Soondrie wood of Calcutta, (Heritiera minor), where it is so common as to serve for fire-wood, although from its superior qualities for buggy-shafts, hackery or cart axles and wheels and other purposes requiring great strength and toughness, it is highly prized.

42 *Naoo.* Used for house posts: the leaves, flowers, and roots are said to be used for medicine. It is a brown, substantial, solid wood, not liable to the attacks of insects.

43 *Nga-soay.* This is a solid, very heavy, reddish wood, and answers for house posts and rafters.

44 *Nyaung-lan.* Saul, "*Shorea,*" of a peculiar kind, employed for beams, rafters, and boat building. The root is used as umbrella stocks.

45 *Onn-thuay.* A white soft wood, not subject to injury from insects; it is employed for common carpentry.

46 *Pad-dan.* Used for making drums and musical instruments. It is a kind of red Sanders wood.

47 *Pa-ngan.* Used for boats and oars; it is a compact white wood, and is also in use for making musical instruments. It seems to be Gmelina arborea.

48 *Pa-ra-wa.* A hard, red, compact wood, with large fibre, and fit for gun-carriages or other similar purposes. It is exempt from attacks of insects. It is used for spears and arrows.

49 *Peng-lay-oun.* Used for spear handles; it is a most valuable wood, compact homogeneous, and very heavy, of a deep brown colour and fine grain, having no tendency to split, and being exempt from attacks of insects.

50 *Pinnai.* This is said to be a fruit tree; the wood affords a yellow dye, and is a compact, handsome, yellow wood, suitable for common cabinet purposes. It is probably an Artocarpus.

51 *Povin-gunyet.* Used for house posts and rafters. It is a kind of Jarrool, "*Lagerstræmia*" a good serviceable wood, and would do for piles, posts, and beams.

52 *Pyeen-ma.* House posts, carts, boats, paddles, oars, &c., are made from this, which is a capital wood, a kind of saul, and would answer for all the purposes of common Saul. Sp. Gr. 0·920.

53 *Raung-thmoo.* Used for house posts; it is a kind of Teak.

54 *Seet-seen.* Used for the construction of religious houses. It is a red, compact, very ponderous, and highly valuable wood.

55 *Tan-labet.* A heavy, white wood, employed for house posts and other common purposes. It is not liable to injury from insects.

56 *Taup-sha.* Employed for house posts, and would answer for common carpentry, but it is subject to split; the bark is supposed to be medicinal.

57 *Teng-khat.* This is a heavy white wood, solid and fit for turning purpose; used for rice-pounders, &c.

58 *Thaò-ban.* This is used for boat-building and making carts; timber sometimes 70 feet long: it is a kind of Teak, but rather heavier than the usual kind. Sp. Gr. 0·814.

59 *Tha-bwot-gyee.* This is a good heavy valuable timber, somewhat like iron-wood.

60 *Tha-byion.* A useful timber, probably a Eugenia.

61 *Tha-khwot.* This wood is useful for sandals ; it is a kind of white Teak.

62 *Thammai.* A strong, handsome wood, like Ægiceras, or box-wood.

63 *Than-kya.* The fruit of this tree is employed for ring-worm. The wood is like Saul.

64 *Thanna-Dau.* Said to be a fruit tree ; it is a reddish-brown, heavy wood, fit for machinery or other purposes requiring great strength ; it is totally exempt from attacks of insects, but somewhat liable to split

65 *Tha-nat.* It is a kind of grey Teak.

66 *Than-that.* Used for stocks of various intruments ; it is a capital wood, and seems to be a kind of Saul.

67 *Theet-phyion.* This is used for fan handles ; it is a useful white wood ,and would answer for common carpentry ; it resembles Mimosa serissa.

68 *Theng-gan.* Employed for house posts, carts, boat-buildings, paddles, and oars. It is an excellent compact wood, fit for gun carriages.

69 *Theet-to.* This is said to be a fruit tree; the wood is employed in boat building, making carts, &c. It is a dark-brownish grey, hard, heavy wood.

70 *Theet-ya.* Employed for rice grinders or pounders. It is a superior, compact, close, tough, brown wood, fit for any thing requiring great strength and durability.

71 *Theim.* Used as house posts, rafters and general purposes of carpentry.

72 *Thep-yeng.* Said to be a fruit tree: the trunk affords a compact, fine grained wood.

73 *Toung-bien.* Used in boat-building and for making carts. It is a strong, heavy wood, well adapted for handles of tools, &c ; it is probably a kind of Teak.

74 *Toung-tha-khwa.* This is a capital wood for any purpose, gun-carriages or gun-stocks.

75 *Toung-tha-byiou.* Used for house posts ; it is a strong, red, heavy wood, a kind of Mimosa.

76 *Toung-thau-gyee.* A hard, compact wood of dark-brown colour.

77 *Tseet.* Employed as house posts and in boat bulding. Saul of small calibre.

78 *Tsekka-doun.* This is said to be a fruit tree ; the wood is used for house posts, rafters, and boat-building ; it is like Teak, but much disposed to split.

79 *Tshan-tshay.* A useful wood, but liable to attacks of insects, and to split.

80 *Tshaup-yo.* Used for house posts and musket stocks. It is a heavy white wood, exceedingly strong, but liable to attacks of insects.

81 *Tshiet-khyeen.* Used for house posts. A superior kind of crooked-grained Saul.

82 *Tshwai-lwai.* Used for musket stocks and sword sheaths ; it is a hard, red, crooked grained wood, fit for cabinet work.

83 *Tsoay-dan.* Heavy, hard, tough wood, not subject to insects, and, being tough and short, it is suited for wheels, musket-stocks &c.

84 *Tswot-ba-lwot.* This is said to be a fruit tree ; the wood resembles Jarrool, a Lagerstrœmia.

85 *Yammandy.* Used for carving images and making drums. It is a useful and valuable wood.

86 *Yeng-taip.* It is a strong useful wood for posts and common carpentry.

87 *Yetha-byay.* This is used for house posts and boat-building ; it is a strong wood, suited for door-frames and common carpentry.

88 *Yoga-theet.* The wood is used for carved images, and the bark used as soap.

89 *Zee-byion.* This is a compact, close wood like Lagerstrœmia, or white Jarrool. It is used for house posts, and is liable to split, but is free from the destructive influence of insects.

90 *Yeng-bywom.* Employed for house posts. It is a useful wood, equal to Jarrool.

(8194) *Woods from Amherst and Tavoy Provinces, and Mergui Archipelago, recommended for helves, by Captain Dance, Deputy Commissary of Ordnance Tenasserim Provinces.*

---

1 *Lagerstræmia Pymmah. Peema Nee.* Red Peema.

Maximum girth 6 cubits. Maximum length 30 feet. Very abundant ; found all over the Tenasserim and Martaban Provinces. When seasoned, floats in water.

Remarks.—A tough wood, very good for helves, already used for such, and for other Ordnance purposes. The great fault of Peema is its liability to shrink and warp when exposed to the sun or to heat. Peema however has not been fairly tried, if killed and left standing as Teak the tendency to warp might probably disappear.

2 *Calophyllum Longifolium. Therapée.*

Maximum girth 3 cubits. Maximum length 22½ feet. Abundant ; found in Mergui, Tavoy, and in lesser quantities near the Attaran River and its branches. When seasoned sinks in water.

Remarks.—Used for masts and yards of Junks excellent for helves but not procurable at Maulmein in sufficient abundance. Strongly recommended to make models.

3 *Tee ka loung* or *Tha* or *Kadat-Ghee.* Burm.

Maximum girth 3 cubits. Maximum length 22½ feet. Abundant ; found at Mergui and Tavoy. When seasoned, floats in water.

Remarks—Used for bedsteads, and for house

building. Recommended as a durable, tough wood for helves or for hammer handles.

4 *Sibia Glomerata. Thayt Pew Tha* or *White Thayat.*

Maximum girth 5 cubits. Maximum length 30 feet. Abundant; found on the sea coast from Amherst to Tavoy, and Mergui. When seasoned, floats in water.

Remarks.—The term, Thayat-pew, should be cancelled from the collection, Thayat Pew, meaning white wood, a name equally applicable to "Calophyllum longifolium," "Dillenia speciosa" and Dalbergia species, and other woods. "Yemam-nee" is often called by this name. The name Pyew is however that of Mangrove in Mason's "Tenasserim," and I cannot succeed in procuring the true Mangrove.

5 *Artocarpus echinatus. Mountain Jack* or *Tong By-ne.* Burm.

Maximum girth 5 cubits. Maximum length 30 feet. Not abundant though to be found here and there over a large expanse of country. Found all over the Tenasserim and Martaban Provinces. When seasoned, floats in water.

Remarks.—This wood, found on seasoning too light and spongy for durability, should be classed as a useless wood.

6 *Xylocarpus Granatum, Penlaypyoung* or *Peng-lay-oun.* The sea cocoanut.

Maximum girth 4 cubits. Maximum length 20 feet. Very abundant; found all along the sea shore from Amherst to Mergui. When seasoned, floats in water.

Remarks.—Used by Burmese for all parts of houses, posts, flooring, walls &c. A very good, fine, strong wood, splits with difficulty. Recommended for handspikes, helves, spokes, and handles of tools, also for shot boxes and packing-cases.

7 *Heritiera Litoralis, Konzozaloo* or *Kanazoe,* from the sea shore.

Maximum girth 4 cubits. Maximum length 30 feet. Very abundant on the Islands; found on Pannat Island and all the Mergui Archipelago, also all along the coast of Amherst province. When seasoned, floats in water.

Remarks.—Used for boats, boxes, planks of houses &c. a very light wood, scented, durable and tough. Recommended for fuzes beyond any other wood in the collection: also for helves, and for gunstocks. Strongly recommended for packing cases of all descriptions.

8 *Heritiera Minor, Kanazoe,* a Forest Fruit tree.

Maximum girth 2 cubits. Maximum length 15 feet. Very abundant, but straggling; found in Martaban, and on both sides of Moulmein river, and all along the sea coast; an unlimited supply of this procurable. When seasoned, floats in water.

Remarks.—Name of this sounded as the other Konnayzow but the wood different. When seasoned also piles of bridges, boats, and many other purposes. Recommended for helves, but should be killed a twelve month before being cut down, or otherwise should be seasoned by keeping after it has been cut down. Both of these "Kanazoe" woods said by Dr. McClelland to resemble Soondree wood in strength and durable qualities.

9 *Kannan Tha* or *Crab Tree.*

Maximum girth, 4 cubits. Maximum length 30 feet. Abundant; found on an Island called Piel Island near Mergui, but scarcely procurable in Moulmein. When seasoned, the red variety sinks and the white floats.

Remarks.—Used for houses, zyats &c. a very durable wood of handsome grain. Of this wood there are two kinds, red and white; the latter lighter than the former, likely to answer for helves; the former too heavy for that purpose. Both woods very good for turning purposes.

10 *Kaya Nan* in Tavoy, *Kaiyah* in Moulmein. N. B. The wood called Kyanan in Moulmein and by Mason, is Tavoy red wood Syndesmus Tavoyana.

Maximum girth 2¼ cubits. Maximum length 15 feet. Very abundant; found on the sea coast from Amherst to Mergui: also on banks of river in the Province of Martaban near the sea. When seasoned, floats in water.

Remarks—One of the best woods in the country for helves; tough, light, very durable plentiful; long in the fibre, neither liable to split nor to warp nor to break readily. Used by Burmese for planes, spears, boats, stocks of guns and all kinds of purposes. This wood is of a most beautiful color, a combination of Pink cream color and red, and bears a very high polish. Recommended for helves, handles of tools, handspikes and spokes of gun carriage, and timber wheels; also for gun stocks and planes.

11 *Parrawah.*

Maximum girth 3 cubits. Maximum length 22 feet. Abundant; found all over Tenasserim and Martaban provinces. When seasoned, sinks in water.

Remarks.—A durable smooth-grained tough wood; used by Burmans for sticks, helves for pickaxes, and hoes, handles of chisels and other tools &c. Recommended for helves and handles of tools generally.

12 *Tha Byke* or *Tha-Bay-Kya.* A kind of Oak.

Maximum girth 1½ cubits. Maximum length 16 feet. Not abundant, but scattered; found in all forests inland, all over the provinces. When seasoned, floats in water.

Remarks.—A sufficiently light, yet durable straight grained, tough wood; used by Burmese for posts, building purposes generally, and various other objects. This wood is recommend-

it could be procured in sufficient quantities, would be unrivalled for shot boxes

13 *Gongee* or *Gangaw*.

Maximum girth 3 cubits. Maximum length 32 feet. Very abundant; found near Mergui, also thence along coast as far as Amherst. When seasoned floats in water.

Remarks.—Used for tables, chairs and miscellaneous articles by the Burmese; a good, hard, tough wood, durable and recommended for helves also for handles of all kinds of tools. Vide Major Simpson's Report.

14 *Ancestrolobus Carnea*; *Toungala* in Martaban Provinces, *Zeengalay* in Tavoy.

Maximum girth 3 cubits. Maximum length 30 feet. Not abundant; widely scattered. Found all over the Provinces in the forests, but in none abundant. When seasoned floats in water.

Remarks.—This wood has a good long fibre, tenacity, durability and sufficient lightness, is very free from knots; used by Burmese for building, for ploughs and for utensils of all kinds. Recommended for helves and for handles of chisels, hammers and tools generally—said by Dr. McClelland to be plentiful in Pegu and Tonghoo Forests, but rarely to exceed 3 feet in girth.

15 *Bong long Tha.*

Maximum girth 3 cubits. Maximum length 22 feet. Said to be abundant, but has not been easily obtained in Moulmein. Found all over the provinces. When seasoned, floats in water.

Remarks.—A durable yet light wood with a very straight grain; used for every purpose by the Burmese, and much recommended for helves.

16 *Tha nat Khee.*

Maximum girth 3½ cubits, Maximum length 30 feet. Said to be abundant, but has not been easily obtained in Moulmein. Found all over the provinces. When seasoned, floats in water.

Remarks.—A durable yet light wood with a very straight grain; used for every purpose by the Burmese, and much recommended for helves.

17 *Tay-tha.*

Maximum girth 3 cubits. Maximum length 16 feet. Scarce in Amherst, but abundant towards Tavoy. Found inland also along sea coast all over the provinces. When seasoned, floats in water.

Remarks.—Found subject to dry rot when seasoned; a useless wood not recommended.

18 *Mai tai Yo.*

Maximum girth 2½ cubits. Maximum length 22 feet. Abundant. Found all over the province. When seasoned, floats in water.

Remarks.—Used for posts and many other purposes by the Burmese, a particularly good wood for helves, being durable, light, and tough.

19 *Kya Mouk*, a kind of Oak.

Maximum girth 4 cubits. Maximum length 22½ feet. Abundant but widely scattered. Found all over the provinces inland. When seasoned, floats in water.

Remarks.—An excellent tough wood, durable and sufficiently light; used for all purposes by the Burmese. Strongly recommended for helves, hammer handles, handspikes, staves of casks, and many other purposes, but too widely scattered to be easily obtained, unless a large quantity be ordered which should repay a search in the forests: much used by Burmese as a pole for cavady baskets.

20 *Pa-ka-thau.*

Maximum girth 2 cubits. Maximum length 12 feet. Abundant but widely scattered. Found all over these provinces inland. When seasoned, floats in water.

Remarks.—Used by Burmese to make paddles, oars, &c, a tough, durable, good wood, but too widely scattered to be easily obtained, unless a large quantity be ordered which would repay a search in the forest.

21 *Dillenia Speciosa. Thee-Bew-Tha.*

Maximum girth 3 cubits. Maximum length 22 feet. Trees abundant, but widely scattered. Found all over the provinces here and there inland. When seasoned, floats in water.

Remarks.—A durable, tough, light, wood, seeming very good for helves. Used by Burmese for building houses and for sundry other purposes; said by Dr. McClelland to afford large and good timber for building houses.

22 *Kye-zai: Laurus, species.*

Maximum girth 2 cubits. Maximum length 15 feet. Scarce, not obtainable at Moulmein. Found along the coasts from Amherst to Mergui; also on the banks of Tavoy river. When seasoned, floats in water.

Remarks.—A very tough wood which has already been often used for helves with great success. Proved of extraordinary strength and tenacity in former experiments. Very durable and not too heavy for helves. Recommended for helves and handles of tools of all kinds, if it could but be procured at Moulmein.

23 *Myouk sho* or *Monkey tree*, (also called *Moulmein Lancewood*, *Dalbergia.—Mason.*) so called because its pole is so straight, so slippery, and to so great a height free from branches that no monkey was ever seen to climb it.

Maximum girth 4 cubits. Maximum length 40 feet. Very abundant. Found in Tavoy and Mergui: also somewhat abundant all over the provinces inland. When seasoned, floats in water.

Remarks.—A wood much praised in Tavoy, as resembling Lancewood in properties but found to split when seasoned, perhaps good specimens have not been obtained. At any rate other woods of unquestionable value are abundant in Amherst.

24 *Careya arborea. Ban Bambbooai.*

Maximum girth 3 cubits. Maximum length 15 feet. Abundant. Found all over the provinces inland. When seasoned, floats in water.

Remarks.—This timber is useful, durable and

tough: used for posts of houses, and for country carts. Recommended for helves though better kinds for that purpose have already been specified. Recommended by Dr. McClelland with other woods as equal in strength to oak and of a promising kind for ship-building.

25 *Kye yo Thoo.*

Maximum girth 2½ cubits. Maximum length 15 feet. Very abundant at Mergui, but not procurable at Moulmein. Found inland up the rivers all over the Provinces. When seasoned, floats in water.

Remarks.—An uncommonly smooth grained, tough, close, yet not heavy wood. Durable and with but one fault, the smallness of its girth, unfitting it for gun carriages. Strongly recommended for helves and handles of tools of all sorts, if it can hereafter be procured at Moulmein; also for handspikes and for spokes. This wood, on careful examination, appears to be identical with Trincomallee wood, though this cannot be positively stated till the flowers of the tree can be procured.

26 *Sow-yew*, or Chisel handle tree, called by the Karens Egg tree, stated by Mason to be of the genus Dalbergia, *species* unknown.

Maximum girth 2½ cubits. Maximum length 10 feet. Not very abundant, but found scattered all over these forests inland; always found in undulating ground only not near water. When seasoned floats in water.

Remarks—Used by Burmese in preference to any other for handles of chisels and tools, also for helves of axes, and hatchets. A very hard, fine grained wood, which is strongly recommended for helves and handles of all kinds of tools. Unequalled for those tools, such as chisels, which are struck with a hammer or mallet. This wood is of a yellowish white in color with patches of black interspersed, looking as if Iron had in some manner been drawn from the soil, and incorporated in the wood. Though widely scattered, it is in such demand as always to be procurable in the markets.

27 *Shorea Robusta. In-Jin* or *Enghyen*, called in India *Saul.*

Maximum girth, certainly 3, said to be 5 cubits. Maximum length, certainly 20, said to be 80 feet. Abundant. Found inland in Amherst and Tavoy provinces. When seasoned sinks in water.

Remarks.—A thoroughly good and valuable wood. One of the most durable in these forests, tough, elastic, large, and extremely heavy. Used for bows and for all kinds of purposes, by the Burmese. Recommended for handles of hammers chisels and other tools, also for sheave blocks, cogs, and machinery in which great strength is required. Also for government buildings, wharves &c, especially for Railway sleepers, from its singular property of petrifying when long exposed to the action of water, as also, from its abundance and large girth. Too heavy for helves, said to strike fire with steel, after having been kept in water for a length of time. Major Phayre stated in a letter his having found several logs of this wood in a creek which is empty in the day season, all of them petrified. This saul appears a closer grained, better, and probably a heavier wood than the saul of India; it seems likely to answer admirably for helves, and for rammer heads, as well as for the other purposes already specified in this report.

28 *Melanorrhea Usitata. Theetsee.*

Maximum girth certainly 3, said to be 4 or 5 cubits. Maximum length certainly 20, said to be 30 feet. Very abundant. Found in Amherst Province. When seasoned floats in water.

Remarks.—A wood of particularly fine close grain, exuding a black gum which repels ants, and is used by the Burmese as a varnish. Very strong, durable, hard and tough, found to answer well for cogs of Machinery. (Vide Artillery Records with report of woods by Captains Simpson and Babington, dated Moulmein 25th May 1842.) Recommended for handles of tools, also of sheave blocks and for machinery generally and for Railway sleepers. Dr. McClelland writes of this wood as follows. "The Lignumvitæ" of Pegu. It is of a dark red color, of a close grain and dense structure. Its great hardness and weight prevents it being employed in house building. It would answer for sheave or block pulleys and other purposes connected with machinery, where great strength and density are required. The anchors of Burmese boats are always of wood to which stones are lashed. The flakes being of Pyeng Khadoe, the stocks of Theetsee or of some other heavy wood. This wood is not brought to Moulmein so heavy as Dr. McClelland describes it. It is procurable at 7 cubits and on high or low ground. Recommended for gun stocks, also for rammer heads, and for helves, *in short* for all purposes as so strong yet not very heavy.

29 *Fagræa. Fragrans, Annan-Tha* or *Annan.*

Maximum girth 4 cubits. Maximum length 20-25 feet. Very abundant. Found in the Provinces of Amherst, Tavoy, and Mergui. Also on islands of the Coast and inland, especially up the Attaran river. When seasoned, sinks in water.

Remarks.—Building houses, kyoungs, zyats, &c., also for piles of bridges, wharves &c., but for the last by the English only, as Burmese think this wood too good for any but sacred purposes: hence Annan wood has been more preserved in these forests than any other valuable wood. It is impervious to the attacks of ants, and of the teredo navalis which will eat all other timber. At Tavoy the posts of a wharf which have for several years been partly dry and partly wet, each day according to the state of the tide, are untouched by the worms. The Burmese

have a proverb about the slow growth of this tree. Annan wood though almost imperishable is not capable of bearing so heavy a strain as some of the other valuable woods of the Province. (Vide Artillery Records for 1844, and experiments therein recorded page 531 of "Selections.") Recommended for Railway sleepers, as neither heat nor moisture will warp or rot it.

30 *Hopea Odorata. Thingan.*

Maximum girth 6 cubits. Maximum length 60 feet. Scattered but abundant. Found in the Provinces of Yea on the coast beyond Amherst, also at Mergui, and in lesser quantity near Moulmein. When seasoned, floats in water.

Remarks.—Formerly considered the most valuable indigenous timber in the southern Provinces. Used at Tavoy and Mergui for building houses. Used also for canoes, junks, &c. A very durable excellent wood when kept under water as in the planks of a boat or under cover on land; but often liable to split when exposed to the sun in a dry state. Recommended for helves.

31 *Inga Xylocarpa. Pyeng Khadoe.*

Maximum girth 3 or 4 cubits. Maximum length 20 or 25 feet. Very abundant. Found all over the Tenasserim province, also at Mergui and Tavoy. When seasoned, sinks in water.

Remarks—This, the Iron wood of these provinces, resists nails, which cannot be driven into it. Used for crooks of ships, posts, piles, bridges, &c. Recommended for handles of chisels, gouges, &c. but too heavy for other ordnance purposes. Excellent for railway sleepers. The only Pyeng Khadoe which I can procure here (and I have had many specimens) has been eaten by worms in seasoning, and proved inferior. I suspect that the real Pyeng Khadoe has not yet reached me.

32 *Hopea Odorata. Thingan Pew*, or White Thingan.

Maximum girth 4 cubits. Maximum length 30 or 40. Scattered but abundant. Found in the same localities as the red Thingan. When seasoned, floats in water.

Remarks.—A lighter variety of the red Thingan. This is a tolerable wood for durability, and would do for helves, but more suitable woods are in the list of those recommended.

33 *Acacia elata. Thaeet-Tha.*

Maximum girth 4 cubits. Maximum length 18 feet. Very abundant. Found all along the sea shore from Amherst to Mergui. When seasoned, floats in water.

Remarks.—Used for posts of building, a very durable wood; abundant and of such girth, might be advantageously employed for packing cases, also, for Government buildings in Burmah. Recommended by Dr. McClelland for cabinet making.

34 *Pet-Than.*

Maximum girth and length not ascertained; abundant in Tavoy, not procurable in Moulmein, found in Tavoy and Mergui. When seasoned, sinks in water.

Remarks.—A very hard and durable wood, used by Burmese for wedges. Not recommended, because only procurable at Tavoy and Mergui.

35 *Mezzale.*

Maximum girth 4 cubits. Maximum length 30 feet. Scattered, not very abundant. Found all over the Provinces. When seasoned, floats in water.

Remarks.—Used by Burmese for rulers, malletts and walking sticks; of very handsome streaked grain like palmyra wood, but not sufficiently durable to be recommended for ordnance purposes.

36 *Meenaban*; *Apocinaceæ*, or Tavoy Lance wood. Classed by Mason as one of the apocynaceæ and called by him Tenasserim Lance wood.

Maximum girth 1½ cubits even in Tavoy and Mergui where largest. Maximum length 12 feet. In moderate quantities. Found from Tavoy, Mergui and adjacent islands; also in smaller scantling and scarce, in Amherst Province. When seasoned, floats in water.

Remarks—Used by Burmese for bows, spears, walking sticks, dhar and chisel handles, &c. an excellent tough, hard, elastic and durable wood, bears a beautiful polish, and makes excellent furniture; when wanted in but small size only, much recommended for handles of screw drivers, hammers, planes, and all kinds of tools; also for all purposes for which a close grained heavy wood is required. (Vide Major Simpson's Report.) Does not seem to stand exposure to the direct rays of the sun well, but under cover is found to be a thoroughly good wood for planes, for which this is especially recommended, also for screw drivers and all kind of turning. This is good for all those purposes for which box is now imported.

37 *Laurus* (*Sassafras*). *Carrawaytha*, or *Sassafras wood.* Maximum girth 3 cubits, rarely 4. Maximum length 20 to 30 feet. Not very abundant but procurable. Found from Amherst to Mergui, all along sea coast at Yea, Henzay and other places. When seasoned, floats in water.

Remarks—Used for interior of junks, also for inside works of drawers, boxes &c. as it has a smell which repels insects. A durable wood found, when seasoned and worked up, remarkably tough and strong, excellent for planes, helves, and handles of tools generally, and would be excellent for almirahs in which to keep serge, hospital clothing &c.

38 *Pouk-Tha* or *Than-Yen.* Dr. McClelland reports probably Inga bijemina.

Maximum girth 3 to 4 cubits. Maximum length 22 feet. Widely scattered but abundant. Found inland all over the Provinces. When seasoned, floats in water.

Remarks.—An excellent and durable wood,

would do well for handles of tools. This wood is of the same nature as Pyeng Khadoe, of which it is said to be a variety, and the same remarks apply to each of these woods.

39 *Maikay*; *Murraya, species.*

Maximum girth 1 cubit. Maximum length 15 feet. Abundant in Tavoy, but scarce near Moulmein. Found in Tavoy and Mergui districts inland. When seasoned, floats in water.

Remarks.—Too scarce for helves, but recommended for handles of planes, chisels, hammers &c. Used by Burmese for handles of knives and other weapons, a strong, tough wood, in grain like Box wood—(Vide Major Simpson's Report). Recommended by the Ordnance Carpenters as the very best wood, in the collection for planes or for any purpose in lieu of Box.

40 *Pterocarpus Dalbergiodes*, Peddowk or Tenasserim Mahogany.

Maximum girth 6 or even 7 cubits. Maximum length 15 to 30 feet, that of great girth always short. Abundant but scattered. Found all over the Provinces. When seasoned, sinks in water.

Remarks.—A wood already used for gun carriages and for other ordnance purposes and too well known to require comment. This wood takes about two years to season; when cut it has a peculiar and fragrant smell. The ordinary Peddowk, as used in the Gun Carriage Manufactory, needs no comment, but a wood called Peddowk is procurable in abundance at Tavoy, It seems very strong but does not sink and is devoid of smell.

41 *Pinatha*. A kind of Jackwood or a Laurus.

Maximum girth 5 cubits. Maximum girth 25 feet. Very abundant. Found all over the Provinces particularly in the old deserted Town. When seasoned, floats in water.

Remarks.—A light wood with a yellow hue which darkens on exposure. Useful from the yellow dye which boiling extracts from it and which is permanent in cloth, and not effected even by boiling water. It is used by Phoongees. This wood has a fine tone when struck, and is used for musical instruments by the Burmese, it is used by English brush makers for the backs of hair brushes, being a handsome wood which takes a good polish.

42 *Ta-Kouk Tha* Tavoy, *Yay Mine.* (Burmese).

Maximum girth ½ cubit. Maximum length 7 feet. Abundant. Found all over the provinces. When seasoned floats in water.

Remarks.—A durable wood, likely to make good helves or to be useful in turning. Too small in size however to be recommended.

43 *Tin Book Tha.*

Maximum girth, 1 cubit, maximum length 8 to 9 feet. Scarce. Found in Tavoy and Mergui districts. When seasoned, floats in water.

Remarks.—A very good, tough, light wood; used by Burmese for many purposes but too small and too scarce to be worth procuring for helves.

44 *Them-Mai-Tha.*

Maximum girth 2½ cubits. Maximum length 12 feet. Very abundant. Found on both sides of Moulmein River, and on sea coast: in fact all over these Provinces. When seasoned, floats in water.

Remarks.—A wood useless except for firewood, but burns with an intense heat, and is therefore used in preparing salt. Apparently an excellent wood for charcoal for the Arsenal forge or for steamers.

45 *Valeria Lanceolata Pantheya* or *Panthit-ya.*

Maximum girth 6 cubits. Maximum length 60 feet. Very abundant in Tavoy and Mergui, but scarcely procurable in Moulmein. Found in Tavoy and Mergui districts: also along the coast near Amherst. When seasoned, floats in water.

Remarks.—This tree is erroneously called white Thingan, but it is of a totally different order from that of the Thingan. This is said in Remarks by Major (then Captain) Simpson to be still closer and heavier than Thingan (Vide Artillery Records for 1842). Excellent for tool handles, and planes, in short in lieu of Box-wood. Like Sow-yew, the Chisel-handle tree, it has a peculiar grain apparently of iron running through it. The Burmese use this wood for all purposes for which Thingan is employed, especially in junks. An excellent wood, but with not sufficient spring for helves. Stated by Burmese, in Amherst, not to be quite so durable or quite so good as Thingan; though this is not accordant with Major Simpson's opinion already quoted.

46 *Kyaitha* or *Itchwood.*

Maximum girth 4 cubits. Maximum length 18 feet. Abundant but scattered. Found up the Attaran, Gyne, and Thoungween Rivers near Moulmein and near Tavoy and Mergui. When seasoned, floats in water.

Remarks.—A very compact hard timber, used for posts of houses, zyats, &c. The fibre liable to start with repeated percussion, and the wood itself subject to dry rot, therefore not recommended. This is called Itchwood because the fruit, chips, or bark produce, when touched, an itching like that caused by Cowitch.

47 *Chee Neb* or *Stinking Wood.*

Maximum girth 4 cubits. Maximum length 22½ feet. Abundant. Found in Tavoy and Mergui. When seasoned, sinks in water.

Remarks.—The flowers of this wood have an intolerably fetid sickening smell, hence its name; used by Burmese for boxes, tables &c. a long fibred tough wood when new, but rots so readily

that with a whole tree in my possession I cannot cut out a decent specimen.

48 *Kyet Thay* or *Theeay Kyay*. Dimensions and extent of supply not known. Found on sea coast from Amherst to Mergui. When seasoned, floats in water.

Remarks —Used for posts of houses, very durable but not recommended as liable to split.

49 *Dagoo Tha*, meaning Crooked Timber. Maximum girth 3 cubits. Maximum length 30 feet. Abundant. Found in Tavoy and Mergui. When seasoned, floats in water.

Remarks.—Used for building boats, for planks of houses, ladders &c. liable to attacks of worms and dry rots.

50 *Kanyeen Tha* or *Wood Oil Tree*. Named by Mason as Dipterocarpus Lævis. Maximum girth 6 cubits. Maximum length 70 feet. Very abundant. Found all over the provinces. When seasoned, floats in water.

Remarks.—Used for rafters and planks, an inferior wood, by no means durable, rots as soon as exposed to water and shrinks readily. Dr. McClelland speaks of this wood most favourably and states it to be of the Saul family. He must mean some other wood, as this is decidedly a bad wood, very porous, and when kept the oil oozes out and stands in globules over it, it warps to a great extent, and though used for cases does not last for more than about two years. (Vide No. 81. page 135 of Dr. McClelland's Report, where this tree is classed as Dipterocarpus turbinatus.)

51 *Ka Meen Tha.*

Maximum girth 2 cubits. Maximum length 25 feet. Abundant. Found all along sea coast near Tavoy and Mergui. When seasoned, sinks in water.

Remarks.—Used for posts and planks of houses; very heavy and durable, but too easily split to be recommended.

52 *Young Tha.*

Maximum girth 3 cubits. Maximum length 30 feet. Found in moderate quantities along sea coast near Tavoy and Mergui. When seasoned, sinks in water.

Remarks.—Used for posts and planks of houses; a heavy and durable wood, not bad for planes or handles, though better woods are already specified.

53 *Neen Tha.*

Very abundant. Found along sea coast near Tavoy and Mergui. When seasoned sinks in water.

Remarks.—Used for rafters of houses; a very heavy wood, but liable to split, therefore not recommended.

54 *Pew Bock.*

Maximum girth 3 cubits. Maximum length 25 feet. Very abundant. Found along sea coast near Tavoy and Mergui. When seasoned, sinks in water.

Remarks.—A strong, tough, durable wood; recommended for helves.

55 *The-La-Bay.*

Maximum girth 3 cubits. Maximum length 20 feet. Not very abundant, obtained from Tavoy, Mergui and Yea. When seasoned, floats in water.

Remarks.—A brittle, useless wood for Ordnance purposes, though employed by Burmese for house posts and to support the shafts of wells.

56 *Mong-dayat nee* or *Red Mong dayat.*

Maximum girth 2 Cubits. Maximum length 15 feet. Not abundant. Found on sea shore from Amherst to Mergui and on Callagouk Island. When seasoned, floats in water.

Remarks.—Used for crooks, and straight parts also of ships, and boats: a light tough wood with a good grain, but too liable to rot to be recommended.

57 *To Dooryan* or *Forest Dooryan.*

Maximum girth 3 cubits. Maximum length 18 feet. Scarce. Found from the sea coast of these provinces and adjacent islands. When seasoned floats in water.

Remarks.— A soft, light, useless timber, liable to rot readily.

58 *Book Tha.*

Maximum girth 1½ to 2 cubits. Maximum length 11 feet. Scarce. Found on the sea coast Amherst to Mergui. When seasoned, floats in water.

Remarks.—Used by Burmese for helves, but rots quickly, and therefore not recommended.

59 *Tay Yo Tha.*

Maximum girth 2 cubits. Maximum length 18 feet. Very abundant. From sea coast and adjacent islands of these Provinces. When seasoned, floats in water.

Remarks.—Used for oars and masts of boats. When this wood is cut, a very acrid caustic juice or sap flies from it which will destroy sight, if it touch the eye or, if it fall on the face, it raises blisters. A wood dangerous to work, and not durable; not recommended.

60 *Thay Yo Tha.*

Maximum girth 5 cubits. Maximum length 25 feet. Very abundant. Found all over Tenasserim and Martaban Provinces. When seasoned, floats in water.

Remarks.—A useless wood; rots very quickly; used for temporary buildings.

61 *Maneeoya*, stated by Burmese to be much used for rice pounders.

Maximum girth 4 cubits. Maximum length 30 feet. Abundant. Found all over Tenasserim and Martaban provinces. When seasoned, floats in water.

Remarks.—Not a good wood, as, when stored, it soon dies and rots; the roots are used for medicine; the fruit is eaten by Burmese, and the wood is well spoken of, though favourable specimens have not been seen, by Captain Dance.

62 *Mak yuh gah.*

Maximum girth 2½ cubits. Maximum length 18 feet. Abundant. Found all over Tenasserim and Martaban provinces. When seasoned, floats in water.

Remarks.—Used for elephant bells; not a durable wood, and therefore not recommended.

63 *Thah Byay Nee.*

Maximum girth 3 cubits. Maximum length 23 feet. Very abundant. Found all over Tenasserim and Martaban provinces. When seasoned, floats in water.

Remarks.—An inferior brittle wood, used by Burmese in short pieces for the props of houses; not recommended.

64 *Thee Khya Tha.*

Maximum girth 1 cubit. Maximum length 12 feet. Very abundant. Found all over Tenasserim and Martaban provinces. When seasoned, floats in water.

Remarks.—A very crooked grained perishable wood; not recommended.

65 *Dow Yat.*

Maximum girth 2 cubits. Maximum length 18 feet. Abundant. Found always inland all over the country. When seasoned, floats in water.

Remarks.—A soft bad wood, useless except for elephant bells.

66 *May-byoung.*

Maximum girth 3 cubits. Maximum length 18 feet. Not abundant. Found near the sea side, and near the mouths of rivers along the coast. When seasoned, sinks in water.

Remarks—Used for anchors of boats, and for the sticks of oil mills; an uncommonly heavy and a durable wood, but not tough enough for ordnance purposes generally, though from its hardness, it makes good planes and turns well.

67 *Pee Ma Pew* or *White Peema.*

Maximum girth 6 cubits. Maximum length 30 feet. Very abundant. Found all our the Tenasserim and Martaban provinces near the red Peema. When seasoned, floats in water.

Remarks.—A tough wood, lighter than Red Peema; does not last for so long a time as Red Peema, and rots in any position when shut out, as in the hulls of ships, in store &c. Not recommended.

68 *Na Pew Gee* or *Let Thouk Gee.*

Maximum girth 1½ cubits. Maximum length 14 feet. Abundant. Found all over the provinces. When seasoned, floats in water.

Remarks.—An useful wood, of inferior grain, and not durable.

69 *Tha Yingee.*

Maximum girth ½ cubit. Maximum length 6 feet. Abundant. Found all over the provinces. When seasoned floats in water.

Remarks.—Utterly useless except for firewood.

70 *Tha Na Thayt Pew Tha.*

Maximum girth 2 cubits. Maximum length 15 feet. Very abundant.

71 *Kha Moung Tha.*

Maximum girth 2 cubits. Maximum length 22 feet. Very abundant.

72 *Ka theet Tha.*

Maximum girth 4 cubits. Maximum length 22 feet. Not very abundant.

73 *In-Jin Pewoo, White Injin.*

Maximum girth 2 cubits. Maximum length 22 feet. Abundant; found all over the provinces. When seasoned, floats in water.

Remarks.—The above last named four woods very light, perishable, and only fit for firewood. The bark of ka theet tha used by Karens as beetel nut, could probably be useful in tanning.

74 *Thah yay Bew.*

Maximum girth 2 cubits. Maximum length 20 feet. Not very abundant. Found inland all over the provinces. When seasoned, floats in water.

Remarks.—Not a durable wood.

75 *Thay kya Ba.*

Maximum girth 3 cubits. Maximum length 24 feet. Very abundant but straggling. Found inland all over the provinces. When seasoned, floats in water.

Remarks.—Used for house posts, but not a durable wood.

76 *Thay Tha.*

Maximum girth 3 cubits. Maximum length 22 feet. Widely scattered. Found inland all over the provinces. When seasoned, floats in water.

Remarks.—A tolerably good and tough wood, liable to rot in store, and therefore not recommended.

77 *Thah Byay Ynel Ghee* (means with large leaves.) Maximum girth 3 cubits Maximum length 22 feet. Widely scattered. Found inland all over the provinces. When seasoned, floats in water.

Remarks.—A tolerably good and tough wood, spoken of by Dr. McClelland as a strong and close grained timber.

78 *Tha Pyke Tha.*

Maximum girth 5 cubits. Maximum length 30 feet. Very abundant. Found along the banks of rivers, all over the provinces. When seasoned, floats in water.

Remarks.—A wood of no durability, not recommended.

79 *Kyai Yew.*

Maximum girth 3 cubits. Maximum length, 22 feet. Rather scarce. Found all along the banks of rivers all over the provinces. When seasoned floats in water.

Remarks.—Used by Burmese to make charcoal, also sometimes for posts of small huts: too brittle to be recommended.

80 *Toung Bye Nay.*

Maximum girth 5 cubits. Maximum length, 30 feet. Scarce. Found along the banks of rivers all over the provinces. When seasoned, floats in water.

Remarks.—A brittle short-grained wood. Not the mountain jack though similar to it in name.

81 *May Shoung.*

Maximum girth 2½ cubits. Maximum length 18 feet. Scarce. Found on sea coast, Amherst to Mergui. When seasoned, floats in water.

Remarks.—A short fibred, brittle, yet soft wood, not durable; called, but erroneously, a kind of Annan by the Burmese. Not a durable wood, and besides too scarce for ordnance purposes.

82 *Tha Bate Kee.*

Maximum girth 3 cubits. Maximum length 18 feet. Scarce. Found all over the Province near the sea and at the mouths of rivers. When seasoned, floats in water.

Remarks.—A short, fibred brittle, yet soft wood, not durable.

83 *Mong-Dayat Pew, or White Mong-Dayat.*

84 *Maximum* girth 2½ cubits. Maximum length 22 feet. Scarce. Found all over the provinces near the sea and in the mouths of the rivers. When seasoned, floats in water.

Remarks.—Not a good wood, being very perishable.

85 *Kab-Ban-Tha.*

Maximum girth 6 cubits. Maximum length 30 feet. Scarce. Found inland in Amherst and Tavoy Provinces. When seasoned, floats in water.

Remarks.—Makes beautiful furniture, and when long buried in ferruginous mud, turns of a *very dark* red. Found to make excellent planes; used in Tavoy jail with great success, for all tool handles, and much recommended for such as do not receive direct percussion, as screw drivers, augers, hammers, handles; in fact for all tools except chisel handles, which are to be struck with a hammer, for which the Chisel-handle tree, "Dalbergia," *Species*, is the best; makes excellent planes; stated by Dr. McClelland to be most plentiful in Tharawaddy district, and to be hard, of fine grain and used in constructing carts. The writer has seen a quantity of this lately sold (in August 1857) for export to Holland as a furniture wood.

86 *Kyee Tha,* named by Mason as *Syndesmus Tavoyana*; and also called *Kyay Mi-shoung*, named by Dr. McClelland as *Barringtonia acutangula.*

Maximum girth 2½ to perhaps 3 cubits. Maximum length 10 or 12 feet Very scarce in Moulmein, but sufficiently abundant at Tavoy. When seasoned, sinks in water.

Remarks.—Same as Kab-ban-tha.

87 *Tha Boug Pew.*

Maximum girth 2 cubits. Maximum length 15 feet. Abundant. Found on the sea coast, Amherst to Mergui. When seasoned, floats in water.

Remarks.—Liable to attacks from worms, rots readily, a brittle inferior wood.

88 *Koung Moo.*

Maximum girth 5 cubits. Maximum length 30 feet. Scarce. Found near Moulmein, also near Tavoy and Mergui on the sea coast and on the banks of rivers. When seasoned floats in water.

Remarks.—Not a good wood, but perishable and liable to rot readily.

89 *Na Yoo-ya.*

Maximum girth 3 cubits. Maximum length 22 feet. Scarce. Found all over the provinces. When seasoned floats in water.

Remarks.—A durable tolerable good wood with a curled grain; used by Burmese for oars, much like English oak in appearance, but deficient in tenacity. Not recommended, being scarce, while equally good woods are abundant.

90 *Khai Yah.*

Maximum girth 2½ cubits. Maximum length 22 feet. Scarce. Found all over the Province. When seasoned, floats in water.

Remarks.—A tolerably good wood, but not recommended because like the "Na-yoo-ya" it is too scarce.

91 *Dalbergia Latifolia, Yendaik; Black wood.*

Maximum girth 2 cubits. Maximum length 10 or 12 feet. Abundant in Tavoy and Mergui, elsewhere scarce. Found all over the provinces, but mostly in Tavoy and Mergui. When seasoned, sinks in water.

Remarks.—This, unlike the Black wood of India, has a fetid smell like that of new Corduroy and a white grain interspersed amongst the black and red. It is not so handsome a wood as Indian black wood, but is far tougher, is not brittle, excellent for spoke shaves, for handles of screw drivers augers, gimblets. Used by the Chinese carpenters for planes, and is excellent for that purpose though heavy; but they use smaller planes than we do. Like others of the hardest woods of Burmah, it is so full of natural cracks, that two feet of timber are wasted for one foot made up after being sawn; but when made up, this wood cracks no more and resists sun or rain admirably. The "Tai" is not Yendaik but Ebony, and is brittle and devoid of smell.

92 *Phyoo.*

Maximum girth 1½ cubits. Maximum length 17 feet. Abundant. Found in Tavoy and Mergui, also in less abundance in Amherst Province. When seasoned, floats in water.

Remarks.—A tolerably good strong wood, but not with much tenacity of fibre.

93 *Tye Yoo Tha or Lan Thah.*

Maximum girth 2 cubits. Maximum length 22 feet. Scarce. Found in Tavoy and Mergui, also in less abundance in Amherst province. When seasoned, floats in water.

Remarks.—A bad brittle wood readily splits and warps.

94 *Phet Honway.*

Maximum girth 3 cubits. Maximum length 22 feet. Scarce. Found at Tavoy and Mergui. When seasoned, floats in water.

Remarks.—A short grained brittle wood, splits and rots readily.

95 *Ouk Guay.*

Maximum girth 1½ cubits. Maximum length 15 feet. Scarce. Found all over the provinces. When seasoned, floats in water.

Remarks.—The root of this tree is used as a medicine by Burmese, the wood perishable, and grain short.

96 *Nyy-soung Tha.*

Maximum girth 3½ cubits. Maximum length 22 feet. Abundant. Found all over the provinces. When seasoned, floats in water.

Remarks.—A wood of no durability or strength; splits readily, with a short grain. Only fit for firewood.

97 *Na Ghee.*

Maximum girth 3 cubits, Maximum length 15 feet. Abundant. Found all over the provinces. When seasoned, floats in water.

Remarks.—A tolerably good wood, used for malletts, but not durable enough to be recommended.

98 *Tayet Khyee.*

Maximum girth 2 cubits. Maximum length 15 feet. Abundant. Found all over the provinces, When seasoned, floats in water,

Remarks.—A pretty wood in grain, but one which rots when it dies: of no durability.

99 *Murrh Neen.*

Maximum girth 2 cubits, Maximum length 15 feet.

Abundant. Found all over the provinces on low grounds. When seasoned floats in water.

Remarks.—A petty wood, looks exactly like deal, but stated to have no durability.

Additional List of Woods, by Captain Dance, Dep. Commissary of Ordnance, T. P. 28th July 1856.

100 *Yemmanee,* Tree not known but Karens say it bears a yellow flower and small plum which is the favorite fruit of the barking deer. Vide Masons Tenasserim, page 213.

Maximum girth 4 cubits. Maximum length 20 to 30 feet. Very abundant. Found inland near the banks of the Gyne and Attaran Rivers and at the back of the Mountains near Moulmein. When seasoned, floats in water.

Remarks.—Very durable; used by the king of Ava for his carved furniture, also by Burmese for boats, a slightly scented wood, the lightest in the collection; free from cracks. Excellent for fuzes and appears quite free from acid or from tendency to rot.

101 *Soway Do.*

Maximum girth 1½ cubits. Maximum length 10 or 12 feet. Very abundant. Found on sea coast and on the banks of rivers in these provinces. When seasoned, floats in water.

Remarks.—A wood much recommended for gun stocks with but one fault; that it is crooked and therefore not more than ten or twelve feet can be procured between the bends. This wood is commonly sold to Burmese for half rupee a piece, large enough to make one gun stock.

102 *Thayet Kya.*

Maximum girth 2 cubits. Maximum length 20 feet. Not very abundant, but occasionally procurable. Found inland near the back of hills near Moulmain, and here and there all over the provinces. When seasoned, floats in water.

Remarks.—Durable and light, a good wood for helves if indented for with other woods for the same purpose.

103 *Chin Zooay.* Meaning Elephants-teeth.

Maximum girth 1½ to 2 cubits Maximum length 10 feet, Abundant on the hills. Found inland, always on rocky barren hard ground in mountainous or hill districts all over the provinces When seasoned, sinks in water.

Remarks.—This wood is believed by the writer to be the hardest and strongest known in these latitudes, perhaps anywhere in the world. It is however only procurable in such rocky spots as no other tree will grow in, so must be sent for on purpose. It cuts up as does yendaik and other hard woods do with huge cracks through it; in fact this is the most wasteful of all known valuable timber in this respect and the original scantling is but small, so that it is not recommended for general purposes, but it is invaluable for the edges of Phillester Planes for spoke shaves and for such purposes in which much scantling is not required.

104 *Than That.*

Maximum girth 2 to 3 Cubits. Maximum length 12 feet. Very difficult to procure. Found inland up the Gyne and Attaran Rivers. When seasoned, floats in water.

Remarks.—Very durable; used by Karens for bows, for shoulder yokes, spear handles and many other purposes. Excellent for hammer handles from its tough fibre.

105 *Yeen Ga.*

Maximum girth 2 cubits. Maximum length 15 feet. Very abundant, found in Moulmein itself, and scattered over the provinces. When seasoned, sinks in water.

Remarks.—Stated to be good for helves, not so strong as Chisel handle tree but possessing its properties in an inferior degree; and good

for helves. Rupees 45 per 50 feet by 1 foot square Used by Burmese for helves, for mamotties, and is a very pretty white wood for furniture.

106 *Moketammatha.* Meaning Martaban wood.

Maximum girth 1 cubit. Maximum length 8 feet. Very abundant; found in Martaban and its adjacent jungles, also all over the provinces especially on the banks of rivers. When seasoned, sinks in water: uncommonly heavy.

Remarks.—Stated to be used for the same purposes as chisel handle tree, but still stronger.

107 *Gyew.*

Maximum girth 2 cubits Maximum length 15 feet. Abundant; found in the jungle round Moulmein and all over the provinces. When seasoned, floats in water.

Remarks.—Stated by Burmese to be equal to chisel handle tree, Dalbergia, species, but if so the writer has not yet seen a favorable specimen.

108 *Pinlay Jallat.*

Maximum girth 2½ to 3 cubits. Maximum length, 15 feet. Tolerably plentiful. Found by the sea side and very near to waters edge, in these provinces. When seasoned, floats in water.

Remarks.—A wood strongly recommended for fuzes, free from oil, and acid, light, yet strong; it is much used for rockets of enormous dimensions and for wooden guns, used for the burning of the dead Phoongees and on other occasions.

109 *Bee-ew*, not identical with *Thee Bew Tha.*

Maximum girth 3 cubits. Maximum length 22 feet. Trees very abundant. Found near the sea or the rivers edge, all over the provinces. When seasoned, sinks in water.

Remarks.—A very hard, strong wood; used in rice mills where great strength and wearing well are indispensably required: recommended for handles of tools.

110 *Kussoo*, not identical with Kye-zai.

Maximum girth 2 cubits. Maximum length 15 feet. Abundant. Found near the sea or the rivers edge, all over the province. When seasoned sinks in water.

Remarks.—A very tough wood, durable, and as good as Kyezai, for helves. The Kyezai is a wood of the colour of oak with a yellowish tinge. The Kussoo is nearly white. This is not the soondree wood, of which latter the Burmese name is nearly the same, and the soondree wood Captain Dance failed to procure hitherto.

111 *Kyai tha.*

Maximum girth 1½ to 2 cubits. Maximum length 7 feet. Scarce. Found on low marshy grounds in these provinces, but widely scattered. When seasoned, sinks in water.

Remarks.—Excellent for planes, or for any other purpose, for which a straight grain, great toughness and strength are required.

112 *Phangah.*

Maximum girth 4 cubits. Maximum length 23 feet. Very abundant. Found in jungles near Moulmein and all over the provinces. When seasoned, sinks in water.

Remarks.—Used by Burmese for poles of carts and by the poorer class for houses; very strong and likely to make good planes, handles, or helves.

113 *Tunyeen* or *Tunyeen Dha.*

Maximum girth 5 cubits. Maximum length 30 or 40 feet. To be procured in moderate quantities. Found scarce near Moulmein and Sittang rivers, more abundant near Tavoy and Mergui. When seasoned, floats in water.

Remarks—Used for construction of those very large boats which go from Moulmein to Tonghoo; hence in much demand here, but not so much so on the sea coast. A wood which when cut, has a peculiar and fragrant smell, is tough and oily, and likely to make excellent planes, handles &c. &c.

114 *Ebony. Diospyros, Tai.*

Maximum girth ½ to 1 cubit. Maximum length 8 feet. Very scarce. Found from the forest in the direction of Shuay Gheen. When seasoned, sinks in water.

Remarks—This wood, much sought for by Captain Dance could not be procured in Moulmein in sufficient abundance for it to be suitable for any ordnance purpose.

Concluding Remarks dated Moulmein 30th September 1857. From all enquiries, it appears that the prices of all the useful woods specified in the above List are about the same, viz: Rupees 45 per ton. This List is in substitution of that before forwarded with letter No 305 dated first May 1856 from Captain Dance to the Military Board; which latter was requested to be cancelled. The three headings of woods for helves, woods too heavy but useful for other purposes, and useless woods, have been retained as first classed, though some of the first class have been found useless, some of the second good for helves, and some of the third (as yendaik) valuable; but fresh numbering would cause confusion, and opposite to each wood is specified, whether it be useful, and if so for what purpose.

(8195) *Archipelago of Eastern Asia.*

Extensive collections of woods from Borneo, New Guinea, and several other of the Archipelago islands, were contributed to the Exhibition of 1851, including sandal wood from Timor, and Lingoa or Amboyna wood, from Ceram, in the Moluccas.

1 *Lingoa* or *Amboyna Wood.* This wood, which is very durable, and takes a high polish, was imported from the Moluccas in considerable quantities at the time when the latter were British possessions; it is very abundant, and may be had in any quantity. Very large circular slabs are obtained from the lower part of the tree by taking advantage of the spurs, or

lateral growths; they are sometimes as large as nine feet in diameter. A circular disk of wood thus obtained, nearly seven feet in diameter, as well as some other specimens, were exhibited by Messrs. Almeida (P. 891), of Singapore, and were deemed deserving of a Prize Medal by the Jury.

2 *Kayu-Buka.* Specimens were also shown of the "Kayu-Buka," which is brought from Ceram, New Guinea, Arru, and the other islands of the Moluccas, to Singapore; it is a knotty excrescence, which forms on the stems of the Lingoa tree, and is much esteemed as a fancy wood for cabinet-work; of late years its estimation seems to have decreased in Europe, but it is still much valued by the Chinese. For a list of the wood from Labuan—see, Timber of Labuan.

(8196) *Canara Timber and Fancy-Woods.*

The forests of Canara continue to furnish large quantities of the best timber produced in Southern India, but, the government authorities seem to have directed their attention principally to preserving the Teak, Sandalwood, Blackwood, Jackwood, Wild Jack and Poon trees of these forests, to the comparative neglect of other valuable woods. In the years 1843-44 to 1851-52 inclusive, the teak supplied from the Canara forests to the Bombay Dockyards and remaining in store amounted to 7831 logs, equal to 26714 candies, and the expenses incurred in delivering the same amounted to Rs 1,47,277-1-8 or about six rupees per candy. There was, also, in addition, 784 logs equal to 2783 Bombay Candies of Jungle wood. In the Fusly years 1251 to 1260 inclusive there was exported from Canara by sea, of Teak 18,187 candies, Poon Spars 6918 in number: of Sandalwood 86 Candies and Blackwood 362 candies. In 1837, Col. Frith gave a list of 29 woods of Canara. In 1844, Dr. Gibson gave another of 32 Woods; both of these lists were merely in their native names, but, some years later, in 1845-46, the latter gentleman gave a list of 64 timber trees and Fancy woods with scientific, Canarese and Mahratta names, which he had found in the forests of Canara and Soonda. It is as follows.

1 Teak. Tectona grandis. At Gond, Barnunbulee. Mawlinga, Berchee, &c., above the Ghats, and in other parts of Yellapore talook. A few trees in Honore, north of foot of Hosul-Mukki Ghats about 18,000 small estimated in Ankolen and Honawur Divisions. The timber most esteemed in India.

2 Sissoo. Dalbergia latifolia. Cano Betee. Abundant and large at north end of Dandelee forest; scanty eslewhere. Used for Gun-carriages and house furniture. For the former so valuable that large plantations have been formed in waste places of the north-western provinces of Hindostan.

3 Kuree Murra. Ebnoos, *Hind.* Diospyros Ebenum. Not common, found near Oopenputam in Canara; also below the Woolwee Ghat. Only used for delicate and costly cabinet work.

4 Mainthee, *Canarese.* Acen Mack. Pentaptera coriacea. The most common tree in the large jungles both above and below. Beams and pillars for houses: also for ships and boats. The heart wood is one of the most durable known; on account of its weight, it is preferred for firewood.

5 Pentaptera paniculata. Kinjul, *Mahratta.* Kondul, *Canarese.* Nearly as common as the last. Qualities similar to the P. coriacea.

6 Belee Waulke, *Canarese.* Arjoon Sadur. Pentaptera arjuna. Only by rivers and streams mostly below the Ghats; reaches an immense size. Timber commonly reported as good, I would judge it to be inferior to P. coriacea and P. paniculata. Bark medicinal.

7 Goonjun Murra, *Canarese.* Asanna, *Mahratta.* Briedelia montana. Found in Canara, common in Dandelee, where it reaches a great size. Many fine logs have been exported by merchants, since the cutting of teak trees was interdicted. Hardly inferior to teak and stands water equally well. If it has not been already tried for naval purposes, it seems well worthy a trial.

8 Bellee Nundee. Nundee Muna. Bondara also Mana, *Mahratta.* Lagerstrœmia parviflora. Most common in the Dundelee forest above; also not uncommon below; reaches a large size. Wood tough and valued for its qualities in standing water. Greatly in use for beams, rafters and boat timber.

9 Saguree Murra, *Canarese.* Koosumb, *Mahratta.* Schleichera Trijuga. Most common below, where it reaches the size of a large tree; not uncommon in Dundelee forest. Wood very tough and valuable: is always preferred for sugar and rice mills. Fruit gives an oil.

10 Mootr Murra, *Canarese.* Pullus, *Mahratta,* Butea Frondosa. Most common below and in Dandelee forest; grows large, but always gnarled. Wood hardly distinguishable from teak and is of similar qualities. Flowers and gum valuable in the arts, and the former also in native medicine.

11 Cheekul Murra. Keenye. Acacia alata. Found above and below, pretty common. Ripe wood; strong and useful for houses.

12 Halee Dasul, *Canarese.* Tannana, *Mahratta.* Lagerstrœmia Reginæ. The Ben Teak of Malabar. Near the banks of rivers below. Here it reaches large size. Wood of same family as Lag. parviflora; qualities similar. Used in houses and boats.

13 Helbulsoo, *Canarese.* Pat Phunnus, *Mahratta.* Artocarpus hirsuta. Above and in the ravines of the Ghats; but mostly in

Honore and Bilgy talooks. Valuable for canoes and for planks.

14 Ran Funnus, *Mahratta.* Artocarpus sylvestris. Dark jungles on and near the Ghats to southward. Wood of quality somewhat similar to last; but inferior to it.

15 Kori Kowan. Satween, *Mahratta.* Alstonia scholaris. Not very common; but found near the Ghats above and below of great size. Wood white, compact and valuable for the turning lathe.

16 Jamba Murra. Jamba, *Mahratta.* Mimosa Xylocarpa. Chiefly above the Ghats in Soopeh and Dandelee, where it grows large. Wood very useful in house building—tough and strong.

17 Soorhunni, *Canarese.* Koolmurra, *Canarese,* Calysaccion angustifolia. In ravines of the Ghats and below in sheltered valleys; not common in north Canara and Soonda. The tree used here for "Poon" spars.

18 Yetega. Yetegal, *Canarese.* Hedoo. Murra, Nauclea parviflora. Rather common below; more rare above. Is valued as affording the best plank for flooring of houses and house beams.

19 Minjul Mara, *Canarese.* Bukool, *Mahratta,* Mimusops Elenji. In the high jungles close above the Ghats; reaches great size. Wood serviceable for houses, not used in ships or boats. Fruit eatable.

20 Hanee Murra, *Canarese.* Beebla, *Mahratta.* Pterocarpus dalbergioides. Common in large jungles; above and below. Wood strong and useful for houses. Gum used in the arts and in medicine.

21 Bel Kambi, *Canarese.* Acacia amara. Above the Ghats not inland and not north of Gungawalli river. Ripe wood, strong and tough. The natives deem it (wrongly) a species of Ebony.

22 Dal Murra, also Dul Murra. *Can.* Pabba, *Mah.* Chikrassia tabularis. In the tall jungles near and on the Ghats, particularly at Gunesh Good. Wood white, but tough and close grained. From its general situation, it is hardly known to the carpenter.

23 Gher Murra, *Can.* Bibooa, *Mah.* Semecarpus anacardium also Semecarpus cuneifolia. Common above and below, but most so above. Wood good for houses and beams. Juice used in the arts and in medicine.

24 Holgeree, *Can. Mah.* In: Holigarna longifolia. Mostly above near the Ghats S. of Nilcoond. Wood of same qualities as the last. Juice dangerously acrid.

25 Burrul Murra, *Can.* Kanta Saeer. 2 Species of Bombax. Most common below; grows to a great size. Hollowed for canoes; planks sought after for light boxes.

26 Kuta Mura, *Can.* Kudum. Nauclea orientalis. Rather rare and found chiefly below. Wood strong and serviceable, used for gun-stocks. Hardly common enough for house or ship purposes.

27 Sampga, *Can.* Tambut. Kudkee. Hocomlia montana. On and close to head of the Ghats; seldom runs large. Wood white, hard and tough; used for agricultural implements.

28 Dodelee Mura, *Can.*: *Mahrata* no name, Sterculia alata. In deep ravines and sheltered places below the Ghats; grows to an immense height. Used here only as a support for pepper vines. The wood is said to be too spongy for spars, for which its height and straightness otherwise well fit it.

29 Yels Kae, *Can.* Berli Mar, *Mah.* Caryota urens. Throughout the forests above and below; but most common above. Affects sheltered valleys. One of the most useful trees in the country. Pith gives fine Sago meal. Trunk in universal use for water conduits. Root hollowed for the bucket used in irrigation. Abounds in Tari or Palm wine. I have heard that the farm of this tree throughout the Yellapore district of Soopeh, yields Rs. 30,000 per annum.

30 Hali Mura, *Can.* Tursee Phul, *Mah.* Chrysophyllum acuminatum, Star apple. Very common in the jungles near the Ghats above, particularly to the south. Reaches a great height. Wood worthless; fruit eaten. The tree seems to contain the new commercial product termed Gutta Purcha. This product is known to be furnished by a tree of this family.

31 Hagin Kae. Hagin Mura. *Can.* Mar tree not found with us. Nauclea, *Sp.* Flower not seen. Frequent in upper third of the Ghats to the south. Wood described as being strong and serviceable for houses and implements.

32 Kulli Kae. Ficus *Spec*: Generally a climber. Abounds in the country from Bilgy to the Ghats. Juice peculiarly abundant and viscid. It is used as a Bird Lime. Well merits a further examination.

33 Andgeree, *Can.* Ind. Yeroo, *Mah.* Sapindus or Nephelium *Sp.* Flower not seen. Above the Ghat chiefly at the Nilcoond and southern jungles. Wood said to be serviceable in house building.

34 Nooskool, *Can.* Char, *Mah.* Buchanania latifolia. Most frequent above the Ghats, particularly north of Dandelee. Wood is strong and tough, but seldom found squaring above four inches. Fruit delicate like almonds.

35 Kowla, *Can.* Koombha. Careya arborea. One of the most common trees above and below. Always seems to run gnarled. Wood said to be superior for edging of wells as it stands water. Part of the fruit medicinal.

36 Kulgul, *Can.* Kurmul, *Mah.* Dillenia Scabrella. Most common below the Ghat. Grows large, long, and straight. Wood seems to be used for boat plank in Canara. With us it is not reckoned a choice wood.

37 Darsoox Mura. Damun, *Mah.* Grewia obliqua. Found mostly below, seldom grows large. Wood used in agriculture, house posts, &c.

38 Bara Nuge, *Can.* Karumbu. Par Jamb, *Mah.* Olea dioica. Most common and near the Ghats above. Wood white, but strong, compact, and useful.

39 Goonun Mura, *Can.* Gootee, *Mah.* Zyziphus xylopyra. Most common below the Ghats. Never grows very large. Wood used for implements. Fruits employed in the arts.

40 Bomle Mura. Ind. Binteki. Below and near the Ghats only. Wood very serviceable for plank. Seems to be used only for this purpose.

41 Koote Legree, *Can.* Khete, *Mah.* Sapindus. In ravines below: high lands in Canara, not common. Wood of average quality for building. Nut used in the arts.

42 Sarul Mura, *Can.* Kunchun, *Mah.* Bauhinia purpurea. Found both above and below; most common near the Gungawallee creek. Wood strong and good for agricultural implements; but seldom large enough for building.

43 Suola Mura, *Can.* Cedrela Toona Toon. I have found this choice tree only in one situation, viz., island of Koorsulee; but it probably exists all along close below the Ghats. A species of Mahogany. Wood is much used in Bengal for furniture and other purposes.

44 Dhoop, *Can.* Dhoop. Googul. *Mah.* Canarium, 2 species. On the Ghats above, and the second species seems to be cultivated near Bilgil; and also at Siddapore, great size. The choice Gum resin afforded by these trees is extensively used in the arts and exported both inland and to the coast. Wood very good.

45 Mudde Doop. Ind. Ailanthus Malabaricus. Near the Ghats above. Dhoop. Wood worthless, gives a resin nearly similar to No. 44.

46 Allikae. Allubikae. *Can.* Heari. Terminalia chebula. Abounds above the Ghats. Wood of average quality for houses, &c. Nuts have of late years become an extensive export, is a dye in place of nut galls.

47 Taree Mura, *Can.* Yehela, *Mah.* Terminalia bellerica. Common both above and below; one of the greatest trees in the forest. Wood serviceable for houses but not first rate; used also for plank.

48 Tuktuka. Keersel, *Mah.* Bignonia chelonoides. Found above and below, but not common. Wood good for building

49 Parul, *Mah.* Bignonia suaveolens. Common in the Dandelee forest above. Wood of quality similar to last.

50 Wurus, *Mah.* Bignonia quadri-locularis. Mostly in the higher valleys of the Ghats. Wood much used for planks to carts, &c. It is tough and durable.

51 Moorgul Mura. Kokeem, *Mah.* Garcinia purpurea. Wild Mangosteen. Mostly below and near valleys. A beautiful tree. Valued for its fruit which is extensively exported as a native condiment. The concrete oil also is much valued. Wood good.

52 Kirceinula, *Can.* Name not known. Flower &c. not seen. Jungles between Bilgil and Nilcoond; said to be choice wood for masts of boats, &c. Worthy of further inquiry.

53 Undi Mura, *Can.* Goolumb, *Mah.* Samus of 2 species. Abundant in the southern Ghat jungles above, large and straight. Wood good as it abounds in an aromatic oil, which preserves it from insects. It is mostly in situations too remote from water for the wood merchant.

54 Kurwul. Diospyros Ind. *Spec.*: Great jungles in the Ghats above, chiefly to the south. Ripe wood particularly good, as it has the ebony heart.

55 Dal Bulloo Geera; unknown. Elevated plateau between Gungawalee and Black rivers, does not reach a great size. Wood very strong and tough, sought after for agricultural implements.

56 Memecylon tinctorium; Surpa, *Mah.* Iron wood of 2 species. On the upper head of the Ghats; wood very tough and strong for cart axles, &c. The beautiful flowers extensively used as a dye.

57 In Jugga. Hoom, *Mah.* Ind Uvaria spec. Jungles east of Kursulee on Black river; runs tall and straight. Wood strong and useful, it is not much known.

58 Nagin Koora, *Can.* Tabernæmontana citrifolia: common on the hills near and below Ghats. Wood white, but tough and strong. Never large.

59 Kakae, *Can.* Bawa, *Mah.* Cassia fistula: Common above and below. Wood of average quality. Pods a rather extensive article of commercial export.

60 Chikakae, *Mah.* Mimosa saponaria. Ghat jungles generally. Pods and bark exported from Canara—the former as a washing material, the latter for dyeing and tanning fishing nets.

61 Bubbe Mura. Calophyllum spurium. Banks of rivers and streams, above the Ghats chiefly. Wood used for canoes. Seeds afford much oil.

62 Mot. Mooshun Hunoo. *Can.* Garcinia, *Spec*: or a Xanthochymus. Above the Ghats only, where common to the south. Abundant. Juice is not used medicinally. Large Wood good: fruit is eaten.

63 Ghan Seng, *Can.* Khurseng, *Mah.* Bignonia Xylocarpa. Mostly above the Ghats. Wood good. Never reaches a large size.

64 Beta Goonda, *Can.* Uvaria, *Spec.* Jungles inland of Nilcoond. Wood of rather superior quality, being straight and tough.

Errors excepted, (Signed) A. GIBSON,
Supt. Conservator of Forests.

CEYLON WOODS.

(8197) *Ceylon.* The late Sir George Anderson sent us the following list of 96 *Timber Trees* in *Ceylon*, drawn up by Mr. ADRIAN MENDIS, Mohandiram of Moorrotto, and Master Carpenter, Royal Engineer's Department.

NAMES. Cynghalese. Botanical.	Locality. Provinces.	Weight per cubic foot.	Durability.	USES, &c.
A		lbs.	years.	
1 Andere. Acacia vera.	Eastern.	71	15	Cross bars of fishing dhonies, and pins for wooden anchors.
2 Madetiye. Adenanthera pavonina.	Western.	56	30	Common house buildings. Produces a red seed which is roasted and eaten.
3 Kebelle. Oblique Euginea.	Northern.	40	20	Common house building.
4 Cottamba. Almond.	W. & Southern.	38	30	Common house building; and fruit eaten for food.
5 Welipiyanna. Anissa phyllum zeylanicum.	Western and Northern.	35	40	Common house buildings.
6 Cocatiye. Aponogeton crispum.	Western.	56	30	Do. do.
7 Puwak. Areca nut.	Western Eastern and Southern.	57	60	Pins for furniture and pinco sticks. The nuts esteemed a luxury are chewed with nuts betel leaves, tobacco and chunam.
8 Patta Del. Artocarpus, sps.	Southern.	34	30	Boats and buildings. Fruit (9×2½ in,) boiled and eaten as food.
9 Cos. Jack. Artocarpus integrifolia.	South Eastern and Western.	42	25—80	Fruit weighing from 5 to 50lb. used in various ways for food. Timber in general use for building boats, and all kinds of furniture.
10 Del. Artocarpus pubescens.	E. S. & Western.	40	25—50	Boats and buildings. The fruit (9 in. × in) is used as an article of food.
11 Aludel. Artocarpus pubescens.	Western.	51	35—70	Fishing boats and house buildings. The fruit (9 in. ×3 in.) is boiled and eaten as food by the natives.
B				
12 Bairiye.	Northern and Western.	57	10—30	Found chiefly near the mouths of the rivers—used for anchors and in house building.
13 Mee. Bassia longifolia.	Northern.	61	25—80	Keels for dhonies, bridges and house buildings. A useful medicinal oil is obtained from the nut of this tree.
14 Petan. Bauhinia tomentosa.	Eastern.	57		Boxes, chests, walking sticks, cornice work &c.
15 Lunu Midelle. Common Bead tree.	Western.	15	8—20	The small sticks and branches used in common buildings, and outriggers for dhonies and fishing boats; the timber for panels of carriages, buoys, targets, &c.
16 Hal Milile. Berrya ammonilla.	Northern and Eastern.	48	10—80	Casks tubs, carts, waggons and house building. The best wood for oil casks in the Island.
17 Tal. Palmira. Borassus flabelliformis.	Northern and Eastern.	65	80	Reepers, rafters. From its leaves the native ola books are made. Toddy is drawn from the flowers, from which jaggery is manufactured. This is used occasionally for hardening mortar, as also for medicinal purposes.
18 Calukeale, Butea frondosa.	Central.	38	30	Common house building.
C				
19 Calu Mediriye. Calamander. Diospyros hirsuta.	Southern and Western.	57	80	A scarce and beautiful wood; the most valuable for ornamental purposes in Ceylon.
20 Waldombe. Calophyllum acuminatum.	Western.	39	20	Common house buildings.
21 Gorrukeenee. Calophyllum calaba.	Western.	44	25	Poles for bullock carts and house buildings.

Names. Cynghalese. Botanical.	Locality. Provinces.	Weight per cubic foot.	Durability.	Uses, &c.
		lbs.	years.	
22 Dombe. Sweet scented Calophyllum.	Western.	40	5—10	Masts, and cross-sticks of yettra dhonies and fishing boats; and poles of bullock carts.
23 Mahadan. Calyptranthes cumini.	Northern and Western.	36	20	Common house building, wheels, &c. The berries are eaten when fully ripe.
24 Battedombe, Clove tree leaved Calyptranthes.	Western.	45	20	Common house building.
25 Alubo. Jambolana Calyptranthes.	Central.	49	20	Common house building.
26 Kahatte. Careya arborea.	W. & Southren.	38	10—20	Axles for bullock bandies, and buildings.
27 Davette. Carallia zeylanica.	Western.	42	25	Roofings for common buildings.
28 Kittool. Nepera. Caryota urens.	W. & Southern.	71	30—90	Reepers and window bars. The toddy drawn from the flowers is a sweet and cooling drink; and is also converted into jaggery.
29 Dawol kuroendo. Cassia cinnamomum.	Central.	39	20	Common house building.
30 Arremene. Sumatra Cassia.	Central.	57	50	Furniture and house buildings.
31 Hedde woke. Choccar pus pungens.	Western.	58	50	Common house building.
32 Burute. Satin. Chloroxylon Swietenia.	Southern and Eastern.	55	10—80	Oil presses, waggon wheels, bullock carts, bridges, cog wheels, buildings and furniture.
33 Mal burute. Flowered Satin, Chloroxylon Swietenia.	Northern and Eastern.	57	80	Furniture. This wood is perhaps the most valuable in Ceylon next to Calamander.
34 Nelly. Cicca distica.	Central.	49	30	Buildings, wheels, &c. Used in wells the wood is said to purify the water. The berries are made use of for sweet-meats, and also for medicinal purposes.
35 Cocoanut. Cocos nucifera.	Sea coast generally.	70	20—50	Buildings, fancy boxes and furniture. The fruit furnishes almost all the staple articles of food in a tropical climate—milk, curry, water, oil:—the flower yields toddy, from which arrack, jaggery and vinegar is manufactured; the husk coir for ropes, mats, &c.; the leaves are woven into cadjans; and every part of the tree is useful in a multitude of ways.
36 Wea warene. Cratæva religiosa.	Central.	62	60	House buildings and pestles.
37 Hal Mendora. Branch flowered Cynometra.	Western.	56	8—20	Bridges and house building.
38 Gal mendora. Branch flowered Cynometra.	W. & Southern.	57	15—60	Bridges and buildings. The best kind of wood for under-ground purposes.
D				
39 Nendoon. Dalbergia lanceolaria.	W. & Southern.	56	60—80	Buildings and furniture.
40 Daminne.	Eastern.	44	40	Gun-stocks and common house buildings.
41 Gode parre. Toothed Dillenia.	Western.	51	60	Roofs for houses.
42 Horre. Turbaned Dipterocarpus.	Western.	45	15	Roofs of common buildings.
43 Doon. Dipterocarpus sp.	Central.	29	50	House buildings.
44 Dive parre.	Western.	44	20	Common house buildings.
E				
45 Caluvere. Ebony.	N. and Eastern.	71	80	A fine black wood, used largely for buildings and furniture.

CEYLON WOODS.

Names. Cynghalese. Botanical.	Locality. Provinces.	Weight, per cubic foot.	Durability.	Uses, &c.
		lbs.	years.	
46 Kadoembeiriye. Bastard Ebony.	Western.	45	40	Furniture. The heart of this wood is occasionally met with of extraordinary beauty.
47 Kiri walla. Lance leaved Echites.	Northern.	35	30	Used principally for inlaying ornamental furniture and cabinet work.
48 Book attene. Echites scholaris.	Western.	26		Coffins.
49 Timbery. Embryopteris glutinifera.	Northern.	45	20	Common house buildings. The juice of the fruit is used to rub over fishing lines for the purpose of hardening and preserving them.
50 Walboamboo. Eugenia laurina.	Central.	36	15	Common house buildings.
51 Naw-Iron wood. Mesua ferrea.	Western.	72	10—60	Bridges and buildings, &c.
52 Kiripelle. Indian fig tree. Ficus indica.	Southern.	30	20—30	Common furniture and house buildings.
53 Hunukirille, Grewia paniculata.	Southern.	44	25	House building.
54 Belygobel. Telia leaved hibiscus.	Western.	38	20	Carriages, palanqueens and hackeries—found near rivers.
55 Nerreloo. Illicebrum latrum.	Central.	56	40	Common house building.
56 Dive ratembela. Jonesia asoca.	Northern.	58	25	Common house building.
57 Katie kale.	Eastern.	42	25—50	Common house building and in the construction of yettra dhonies.
58 Murute. Lagerstræmia reginæ.	W. & Southern.	42	30—40	Water casks and buildings.
M				
59 Hulanhick, Melia sp.	Central.	39	50	House building.
60 Ramenoidelle, Millingtonia sp.	Western.	48	20	Common house buildings. The sticks make excellent fences.
61 Sappoo. Michelia champa.	Central.	42	20—50	Carriages, palanqueens &c. also in buildings.
62 Sooriva Mara. Mimosa.	Central.	42	20—30	Buildings and common furniture.
63 Moone Mal. Mimusops elengi.	Southern.	61	50	House building and furniture.
64 Paloo. Mimusops hexandra.	Eastern.	68	10—70	Oil presses, bridges and buildings. The berries are eaten when ripe.
65 Morre. Eye ball,	Central.	62	25	Common house building. Berries eaten when ripe. Furnishes the best firewood for lime and brickkilns, next to Galmorre, Nephelium.
66 Etteiriye. Ash leaved Murraya.	Eastern.	61	10—70	Handles of mamoties, hammers and billhooks; and rafters for cadjan roofs.
N				
67 Helembe, Nauclea parviflora.	W. & Northern.	42	40	Common house building.
68 Nebede.	Sou. & Western.	51	20	Common house buildings.
69 Gal morre, Nephelium, sp.	Central.	65	30	House building. Berries are eaten when ripe by the natives. Supplies the best kind of fire-wood for brick and lime kilns.
O				
70 Koang. Ceylon Oak.	Southern.	42	5—10	Native oil presses and wooden anchors. Berries are eaten by the natives.
71 Melle. Olax Zeylanica.	Eastern.	64	40	Common house building.
P.				
72 Patkeale,	Western.	42	40	Common house building.
73 Penebarroo.	Eastern.	61	50—90	Rafters, &c. Fences made of the sticks of this tree are the most durable of all.

Names. Cynghalese. Botanical.	Locality. Provinces.	Weight, per cubic foot.	Durability.	Uses, &c.
		lbs.	years.	
74 Sooriya. Persian.	Central and Western.	49	20—40	Admirable for carriages, hackeries, a gunstock;—also useful for blocks a buildings.
75 Velenge. Pterospermum ruberifolium. R.	Central.	36	5—70	Poles of bullock carts, beetel trays, a gunstock.
76 Hirikoddol. Rhizophora. Sp.	W. & Northern.	49	35	Common house building. From t bark a dye is extracted.
77 Cadol. Leafy mangrove. Rhizophora.	Northern and Western.	65	40	Found chiefly near the mouth of the river —the wood is used for common hou buildings, and from the bark a dye extracted for colouring leather, ne sails &c.
78 Pehimbive. Rhus disipium.	Central.	68	50	Buildings.
79 Otte. Rottleria, sp.	Western.	36	10	Common house building.
S.				
80 Lawoloo. Sapota, sp.	Western.	39	10	Common house building. Berries are eat by the natives.
81 Pamburoo. Simonia citrifolia.	Southern.	48	40	House building &c. When variegated is a beautiful wood and is used for fu niture and cabinet works, Buoys f fishing nets, &c.
82 Daanga. Long flowered Spathodea.	N. and Western.	23		Buoys, for fishing nets, &c.
83 Telemboo, Sterculia fœtida.	Central.	26	30	Common house buildings.
84 Suvande.	Western.	56	30	Common house buildings.
85 Siyembela. Tamarindus Indica.	North Eastern and Western.	80	80	Oil presses, furniture and building. T fruit is a well known and agreeab article of diet.
86 Teak, Ceylon. Taikke Ceylemey. Tectona grandis.	Western.	55	15—60	Bridges and buildings.
87 Teak. Cochin. Taikke Cotchive.	Cochin.	44	15—90	Carts and waggons, bridges, building, a arrack casks. The wood of these cas imparts a fine colour and flavour to t arrack.
88 Teak, Maulmein. Taikke Molmine.	Maulmein.	42	15—90	Do. do. do. do.
89 Ukbeiriye.	Southern.	51	80	Common house buildings.
90 Hal. Vateria indica.	Western.	26	10	Packing cases, cielings, coffins, &c.
91 Caha Milile. Vitex trifoliata.	Southern and Western.	56	15—80	Water casks, pade boats, waggon wheel bullock carts, bridges and house buil ing.
92 Mecan Milile. Vitex trifoliata.	Western.	56	20—90	Bridges, pade-boats, carts and wagg wheels, water tubs, and house building
93 Sappoo Milile. Vitex trifoliata.	Western and Southern.	49	10—40	Water casks, cart and waggon wheel pade-boats, bridges and house building
94 Samedera. Vitmannia trifoliata.	Western.	26	60	Buoys, &c.
95 Walukeene.	W. & Southern.	39	10	Masts of dhonies.
96 Tarrene. Webera cerifera.	Northern.	57	30	Roofings, and in the construction fishing boats and dhonies.

(8198) *Chittagong Woods, by Capt. Marquart.*

1. Conocarpus, Buthna.
2. Diospyros melanoxylon.
3. Dipterocarpus, sargotiah.
4. Acacia, sp, koom koyre.
5. Swietenia chickrassia. Chuckrassee.

Circars; Northern Circars and *Godavery.*

The forests on the Godavery and on the mou tainous tracts which run parallel with the coa in the northern parts of the peninsula, furni a great variety of useful timbers and fancy woo of which perhaps only a small portion have be

determined and made known. The following lists from the Reports of the London Exhibition of 1851 and from that of Madras of 1857, enumerate some woods of value.

1 *Odina wodier*, Goompana wood. Goompana kurra.

2 Ganara wood. Ganara kurra.

3 *Feronia elephantum*. Wood-apple wood; Valaga kurra, Koweet, Vella marum.

4 *Pentaptera tomentosa*. Nulla muddi wood, Nulla muddi kurra : Caroomaroodum.

5 *Pentaptera glabra*. Tella muddi wood, Tella muddi kurra Vel maroodum marum.

6 *Cassia auriculata*. Tangada wood, Tangadu kurra, Auvarai marum.

7 Paya wood. Paya kurra.

8 Annen wood, Annen kurra.

9 *Morinda citrifolia*, Togara wood. Togara kurra.

10 Red dye wood, Vizianagrum Zemindary.

11 *Bombax Malabaricum* or *heptaphyllum* Boorooga wood, Buruga kurra.

12 *Strychnos potatorum*, Induga wood, Induga kurra. Thæ than marum.

13 *Cordia myxa*, Muckaroo wood; Mukkera kurra.

14 Tobica wood, Tobica kurra.

15 Tellavoolemara wood. Telloovoolemara kurra.

16 *Diospyros chloroxylon*, Nullavoolemara wood Nullaveloomara kurra Mimosa cinerea. Vulture wood, Vulture kurra.

17 Ficus racemosa Bodda wood, Bodda kurra.

18 Voodaga Voodaga wood.

19 *Pterospermum Heynei*, Lolooga wood Lolooga kurra.

20 *Thespesia populnea*, Gungrane wood, Gungarane kurra. 5. Poovarasa murum.

21 *Æschynomene grandiflora* Aguste wood.

22 *Erythrina Indica* Bandita wood, Bandita kurra

23 *Sapindus emarginatus* Soap-nut, or Koonkoodoo wood,-Koonkoodoo kurra.

24 Camooga wood, Kumoogamurum.

25 Doduga wood.

26 Cumba wood, Cumba kurra.

27 Goomoodoo wood, Goomoodoo kurra

28 Unkoodoo wood, Unkoodoo kurra.

29 Undooroo wood, Undooroo kurra.

30 Iscarawsee wood, Iscarawsee kurra.

31 Ghantha wood, Gantha kurra.

(8199) The following timber trees of the Godavery forests and of the Circars between Bhadrachellum and Condapillay are extracted from a Catalogue by Lieut B. H. Beddome, published in the Juries Reports of Madras Exhibition of 1857.

1 Ausandra, *Tel.* Acacia ferruginea, Wood very hard and useful: this tree is very like "Prosopis spicigera" when only in leaf.

2 Arawee Neem, *Tel.* Sclerostylis atalantioides. This tree I found in the Circars only. Wood yellow and very hard, might be used as a substitute for box : it is always small however.

3 Balsu, *Tel* Canthium parviflorum, A dark colored hard and pretty wood; good for turning.

4 Bare Kala goru, *Tel.* Spathodea Roxburghii. Wood is said to be useless. Roxburgh however says that it is used for various purposes. Buffaloes are very fond of the leaves.

5 Boja, Godavery Forests, Kouda tangedu. (Circars,) *Tel.* Inga xylocarpa. A valuable timber, grows very large on the mountains.

6 Bilugu. *Tel.* Chloroxylon Swietenia. The satin wood.

7 Buta karamee, *Tel.* Nauclea parviflora. Wood close grained and hard.

8 Badama, *Tel.* Terminalia Catappa. Wood very strong.

9 Botku, *Tel.* Cordia, new species. A very beautiful wood. It would answer as a substitute for Maple for picture frames &c. This tree is abundant in the Godavery Forests near Mahadeopore : it does not extend down to the Circars. It is found near Warungul. It also is indigenous to the Jubbulpore forests, where it is called "Deyngan." It is I feel certain the tree described by Dr. Griffiths as "Hemigymna Macleodii." He described it from dried specimens and thought that the leaves were opposite (instead of alternate) otherwise his description and native name agree.

10 Chinta, *Tel.* Tamarindus India. The tamarind tree, a beautifully grained wood.

11 Chilla, *Tel.* Strychnos potatorum, A very hard and close grained wood.

12 Chitla Matta, *Tel* Gardenia gummifera. A small tree. The wood is hard. The natives eat the fruit.

13 Chandam, *Tel.* Pterocarpus santalinus. A hard red wood, not found on the right bank of the Godavery.

14 Chilka dudugu, *Tel.* Guatteria cerasoides. Appears to be a tolerably hard wood and does not seem to warp. The natives however on the Godavery do not use it, and say that it is soft.

15 China nagee, *Tel.* Lagerstræmia parviflora, Wood said to be good.

16 Chinna kalinga, *Tel.* Dillenia pentagyna. A very strong, hard wood, abundant on the Indrawatty and in jungles on the left bank of Godavery ; not known on the right bank.

17 Chinna botku, *Tel.* Cordia angustifolia. Wood used for posts and in house building. This tree is common about villages in the Circars, but I never, I think, saw it in the jungles.

18 Duria maddee also kora maddee and koraman, *Tel.* Briedelia spinosa. Wood appears to be very strong and good. Cattle eat the leaves most voraciously.

19 Dulchirram, *Tel.* Acacia Halkora. An enormous tree. Wood hard and reddish.

20 Dudippa (Godavery Forests), Chetippa

(Circars). *Tel.* Hymenodyction. A large tree. Wood not used in the Godavery forests.

21 Googal, *Tel.* Shorea robusta, Abundant on the banks of the Indrawatty—a valuable timber. This tree yields the dammer.

22 Goomer tek, *Tel.* Gmelina arborea. The large trees of this yield a very hard durable wood. The yoke for Bullocks is made from it.

23 Ippee, *Tel.* Bassia latifolia. A strong wood, but never felled by the natives, the flowers yield a toddy, and an oil is extracted from the seeds.

24 Irkee (Godavery), Pedabotku (Circars), *Tel.* Cordia myxa. Wood never used by the natives in the Godavery forests. In the Circars ploughs are made from it.

25 Jitegee [Godavery Forests] Yeroogoodoo [Circars] *Tel.* Dalbergia latifolia. A valuable mottled black timber.

26 Jana, *Tel.* Grewia Rothii? Wood very hard and much used in the Circars.

27 Jammee, *Tel* Prosopis spicigera. The natives say that this wood is very inferior.

28 Kanregu, *Tel.* Flacourtia sapida. A very hard close grained wood which does not warp—worthy of attention.

29 Karinga (Godavery Forests) [Pella Manga circars], *Tel.* Gardenia lucida. Wood not used on the Godavery but it is in the Circars. It seems to be very hard and close grained and adapted for turning.

30 Koree (Godavery Forests), Korivipal (Circars), *Tel.* Ixora parviflora. A hard wood.

31. Koorseea—Koorsee, *Tel.* Cluytia collina, Wood very hard and reddish.

32 Kala goru, *Tel.* Bignonia chelonoides. A good fancy wood—abundant on the right bank of Godavery. I did not meet with this or B. suaveolens in the Circars.

33 Kalagoru, *Tel.* Bignonia suaveolens. Wood very similar to B : chelonoides, but of a redder hue.

34 Karchcea. *Tel.* Nyctanthes arbortristis. A hard useful wood—does not attain much size.

35 Karaka. *Tel.* Terminalia chebula. A very hard valuable timber.

36 Kanigu. *Tel.* Pongamia glabra. Wood said to be strong, it does not appear to be used.

37 Komee. *Tel.* Stylocoryne Webera. Wood prettily marked and hard—much esteemed by the natives—it is very small however.

38 Kankadu. *Tel.* Sapindus emarginatus. A yellowish prettily grained wood—it is tolerably hard.

39 Koila Mookree (Circars's and lower Godavery jungles) *Tel.* Wrightea tomentosa. Wood not used—it appears close grained. The juice is a permanent yellow dye. Bark given internally for scorpion bites.

40 Lolugu, *Tel.* Ptereospermum bynea? Wood pinkish and hard, it is generally hollow in the centre.

41 Manchee jamudu. *Tel.* Euphorbia tirucalli, Grows to a large tree. Wood seems hard but i not used.

42 Mamari. *Tel.* Mangifera Indica, the Mang tree.

43 Mushtee or Musadee. *Tel.* Strychnos nu vomica. Wood very hard and strong—white ant will not touch it.

44 Maredu. *Tel.* Ægle marmelos, Wood ver strong. The native dhol is often made from thi wood.

45 Marree. *Tel.* Caryota urens. Abundant o the banks of the Indrawatty—it yields a win and also a meal like sago.

46 Makkam. *Tel.* Schrebera swietenoides A very hard valuable wood—it never warps.

47 Marree. *Tel.* Ficus Indica. The drops o this tree yield a heavy hard timber.

48 Muchi twikee (Godavery forests) Warur gul. *Tel.* Diospyros : sp. A very hard light colore wood.

49 Nerar. *Tel.* Syzygium jambolanum. Woo said to be strong.

50 Nar yepa (Godavery). *Tel.* Hardwicki binata Wood red, very hard and heavy ; ofte hollow in the centre.

51 Nulla muddi, *Tel.* Terminalia tomentos also T. coriacea. Valuable well known timbers.

52 Nara botku, *Tel.* Eriochlena Hookeriana A strong hard wood—(something like the Botku a new species of Cordia)

53 Naooru also Nagool, *Tel.* Premna tomen tosa. A pretty looking wood—worthy of atten tion as a fancy wood.

54 Nulla sandra, *Tel.* Acacia sundra. A ver hard wood—on the Godavery the musal is al ways made from this wood.

55 Nulla kaka mushti, (Circars only.) *Te* Diospyros, sp, D. Sylrtica? Wood whitish an very hard.

56 Nalla mauga, (Circars only.) *Tel.* Randia sp Wood very hard and close grained—a good woo for turning—(a good sized tree armed.)

57 Nulla regoo (Godavery Forests) *Tel.* Car thium didymum. Centre wood mottled and of dark color like old seasoned oak.

58 Nakeera, Ximenia americana. Wood onl used for fuel.

59 Nowlee eragoo, *Tel.* Vitex arborea. Woo hard of a yellowish brown color.

60 Nalla muddee, *Tel.* Maba buxifolia. Ver small—but a hard pretty wood.

61 Pashee also Paunchee, *Tel* Anogeissu acuminatus. A very strong hard timber.

62 Peda sopara (Godavery Forests,) Yerra pa seroo (circars). *Tel.* Dalbergia frondosa. A stron useful timber.

63 Porilla sopara (Godavery) Tella patsarc (circars) *Tel.* Dalbergia paniculata. Wood pe fectly useless—it is arranged in rings with soft substance in between layers.

64 Pal dautam (Godavery). Peda pul me

(Circars). *Tel.* Ehretia lœvis, A hard valuable wood, though not of great size.

65 Peda Karinga, *Tel.* Gardenia latifolia, Wood close grained; promises well for turning.

66 Papirree also Papatta, *Tel.* Pavetta tomentosa. Wood hard but very small.

67 Pedda man, *Tel.* Ailanthus excelsa. Wood soft, never used by the natives.

68 Paspoo Karamee (also Bundaroo) *Tel.* Nauclea cordifolia. A yellowish valuable wood; that of the very large trees is very superior—from smaller trees it seems rather soft.

69 Pul i-shinta, *Tel.* Bauhinia: sp. Said to be a good hard wood—not apparently described. Legume filled with a scented pith.

70 Palla, also peda palla, *Tel.* Mimusops hexandra. Wood very hard.

71 Poosku *Tel.* Schleichera trijuga Most abundant in Godavery forests. Wood hard, heavy and strong. The large musal for pressing the Sesamum Oil is always made of it—also ploughs.

72 Peda kalinga, *Tel.* Dillenia speciosa. A very hard wood. In jungles on the N. of Godavary.

73 Peda dulchirram, *Tel.* Godavery, Dirasau, Circars. Acacia speciosa. A valuable timber.

74 Pedda chilka dudugu, *Tel.* Uvaria tomentosa. A very strong yellow wood, much similar but superior to "Nauclea cordifolia." Cowars are made from it—also used in house building—it does not warp.

75 Peda kal mesura, *Tel.* Casearia sp. Wood light yellow, hard, does not warp—worthy of attention. A large tree—leaves ovate, oblong glabrous, serrulate, flowers 8 anthers capsule 3 valved with 3 ridges on the outside of fruit. Fruit used to poison fish.

76 Patcha botku (Circars only) *Tel.* Cordia polygama. Strong close grained wood (small and crooked.)

77 Poonkee, *Tel.* Gyrocarpus Jacquini. Wood soft and light, much used for making cowrie boxes and toys, takes paint and varnish well. Tella poonkee "Givotea Rottleriformis" is used also for the same purposes.

78 Reygutti, *Tel.* Capparis grandis. Wood very hard and good.

79 Renga, *Tel.* Zyziphus jujuba. Wood strong and much used by the natives.

80 Sheriman, *Tel.* Anogeissus latifolius. Wood said to be one of the hardest in the forests. It grows to an enormous size. Axils of carts generally made of this.

81 Soomee, *Tel.* Soymida febrifuga. Wood very hard and valuable—never rots under ground—very much used in building—of a reddish color.

82 Tek, *Tel.* Tectona grandis. The teak tree.

83 Tella Maddee, *Tel.* Terminalia glabra. A well known timber.

84 Torelaga, *Tel.* Limonia acidissima. Wood very hard—worthy of attention.

85 Telega (Godavery forests and Dekhan) *Tel.* Gardenia sp. Wood very hard, would be very good for turning.

86 Tharra, *Tel.* Grewia tiliæfolia. Grows very large on the mountains—a valuable timber—much used for handles of axes, pellet bows, cowars, walking sticks.

87 Tunkee (Godavery) tookee (Circars) *Tel.* Diospyros melanoxylon. The centre wood black and very heavy. The Godavery ebony.

88 Tella motku, *Tel.* Dalbergia Oojeinensis. Wood valuable—it is rather rare.

89 Thabsee, *Tel.* Sterculia urens. Wood soft and useless.

90 Tella sopara. (Godavery forests only) *Tel.* Acacia elata. Wood strong and much valued.

91 Telsoo (Godavery) Shinduga (Circars) *Tel.* Acacia odoratissima. A valuable well known timber.

92 Togaree Mogillee (Godavery) Mogillee (Circars,) *Tel.* Morinda exserta. Wood hard and useful, does not warp.

93 Tella sandra, *Tel.* Acacia suma Wood very good and strong—abundant in the Aukeesah jungles.

94 Tella tuma, Acacia leucophlæa. Wood hard—it is used for various purposes by the natives.

95 Tuma, *Tel.* Acacia Arabica. Wood valuable and well known,

96 Tella Manga, *Tel.* Gardenia lucida. A close grained wood. I think it well adapted for the lathe.

97 Tedla pal, *Tel.* Wrightia tinctoria. A beautiful wood, hard and like ivory—most valuable for turning.

98 Tella kaka Mushtee, (Circars only,) *Tel.* Sponia? Appears to be Celtis Wightii of Wight's Icones. One of the hardest woods I have ever met with—light colored, well worthy of attention.

99 Tellapoonkee (Circar hills only,) *Tel.* Givotia Rottleriformis. A very light soft wood—See remarks under Poonkee.

100 Usarka, *Tel.* Emblica officinalis. A hard valuable wood.

101 Ulinda also Yelinda, *Tel.* Diospyros chloroxylon? A very hard useful wood, grows to a large tree on Circar mountains; it is generally a shrub about the Godavery forests.

102 Uskia Man (Godavery) Uri-widee (Circars), *Tel.* Cratoeva Roxburghii. Wood very hard. The native dhol is often made of this wood.

103 Udugu, *Tel.* Alangium decapetalum. An ornamental, beautiful wood—attains a fair size in the forests.

104 Wodee, *Tel.* Spathodea Rheedii, (Bignonia spathacea Roxburgh.) Wood strong, whitish.

105 Yeggee, *Tel.* Pterocarpus marsupium, A well known timber. The native dhol is often made of this.

106 Yepa also Yapa, *Tel.* Azadirachta Indica. A valuable timber.

107 Sterculia colorata (Godavery forests,) Wood useless.

108 Bignonia xylocarpa. Wood very hard, tree rare in Godavery forests.

(8200) *Coimbatore List* by Dr. WIGHT, of 133 woods procurable in the Coimbatore district.

1. Diospyros ebenaster Ainsl. *Ebenaceæ* Icon. 188. Acha marum. Tam. This name is copied from Ainslie and I am still uncertain whether this is the species that yields the ebony of the Palghaut jungles, as there is reason to believe more than one species contributes wood black enough to pass current for ebony. The plant produced to me, under that tamool name, is Bauhinia tomentosa a widely different tree but having a very dark or black heart-wood.

2 Chickrassa tabularis. *Cedrelaceæ*, Ill. 55. Aglay marum, Tam. This is the Swietenia chickrassa of Roxburgh and Ainslie, the Chittagong-wood of commerce. Here it, in common with one or two other light red coloured woods, currently passes under the general name of cedar and bastard cedar, and all are extensively employed in cabinet making, this has quite a cedar-like smell.

3 Alangium decapetalum. *Alangieæ*, Icon. 194. Alingie marum, Tam. The wood of this small tree is said by Roxb. to be "beautiful" and when tried was found to sustain a weight of 310 lbs., but it wants size. I have never seen a tree that would give a 10 inch wide plank.

4 Artocarpus hirsuta. *Artocarpeæ*. Angelly marum. Tam. This is the Artocarpus pubescens of Willd. and Ainslie, it is scarcely entitled to a place in this list of Coimbatore woods, being a native of the coast and not extending so far inland. It is a large tree used on the coast for making canoes and such like purposes.

5 Odina woodier *Terebinthaceæ*, Icon, 60 Anny currer or woody maram. Tam. Called also oodav and generally supposed a very useless tree. The wood is very difficult to season requiring to be kept, even in planks, 2 or 3 years, but once well seasoned it is a close grained beautiful wood well adapted for cabinet-making pur-poses.

6 Bauhinia racemosa. *Leguminosæ*. Atche marum, Tam. This is B. parviflora of Roxb., not mentioned by Ainslie. The tree is small but the heart wood exceedingly hard and fine. The bark furnishes a kind of natural rope, being merely peeled and slightly twisted when it is ready for use.

7 Ulmus integrifolia. *Ulmaceæ*. Ayah marum. Tam. large sized tree, wood reddish coloured, good for general purposes—said to yield to boiling water a peculiar odour, which when mixed with common arrack gives it the flavour of the more expensive palmira arrack and enables the venders to obtain better prices for their adulterated article.

8 Givotia Rottleriformis. *Euphorbiaceæ*. Bootallie marum. It seems curious that this tree, so common in Southern India, has not yet been named in any work of systematic botany. I have not yet learned any thing regarding the timber, one carpenter here speaks disparagingly of it, but I do not consider him a trustworthy authority.

9 Bauhinia tomentosa, Ains. *Leguminosæ*, Caat Attie (ebony, Ains-) Tam. This like the atche marum is a strong very dark coloured wood, hence I presume, the name *ebony*. Even the younger branches show the heart-wood very dark brown, the bark of this is also employed as extempory cordage. The plant furnished to me under this name is *bauhinia racemosa*.

10 Lagerstrœmia reginæ. *Salicarieæ*, Icon. 413, Cadali pua. Tam. This tree is more celebrated for its large handsome flowers than for its timber, which last however is used for common purposes.

11 Terminalia Belerica, *Combretaceæ*, Ill, 91, Cattoo eloopœ marum. This is a very large tree, the wood white and rather soft, and considered only fit for fuel,

12 Soymida febrifuga. *Cedrelaceæ*, Roxb, D, 17, Choar kullee marum. This is the Swietenia febrifuga of Roxb, and Ainslie, I have not seen the wood and only know of its existence here from Botanical specimens of the tree brought under that Native name. The wood is said to be most durable and strong.

13 Gmelina arborea. *Verbenaceæ*, Icon. 1470. Coommy marum, Tam. A moderate sized tree rather frequent on the Malabar coast. I do not know any thing of the timber. It is the G. Rheedii of Hooker's Bot. Magazine.

14 Putranjiva Roxburghii. *Euphorbiaceæ*, Royle's Illust. 100 Curroopallay maram, Tam. I have not seen this tree, but Roxburgh describes it as a large timber tree with an erect straight trunk. The wood is white, close grained and very hard.

15 Acacia sundra. *Mimoseæ*, Roxb, C. 225, Currengally maram, Tam. A rather large sized tree wood dark coloured, very strong, a one inch bar sustaining a weight of 500 lbs. it is rather abundant in the jungles here.

16 Terminalia glabra, *Combretaceæ*, Icon, 196. nearly represents this species. Curry mardah marum, Tam. A large tree, wood dark coloured very hard, heavy and strong, inch bars bearing from 430 to 450 lbs. of this large beams are readily procurable for house building purposes. See Marudum.

17 Garuga pinnata. *Terebinthaceæ*, Icon. 1594. Curry vaimooo marum, Tam. A considerable sized tree with a round umbrageous head. I am not yet acquainted with the wood.

18 Acacia odoratissima. *Mimoseæ*, Roxb, C., 120, Curry vaugay marum. A dark coloured strong and heavy wood, takes a good polish, can be obtained in considerable abundance and of good size, viz., about 1 foot square beams, is well fitted for naves of wheels, sustained 570 lbs.

19. Acacia Arabica, *Mimoseæ*, Roxb, C. 149, Curvaila marum, Under the name of Babool this

very hard wood is extensively known, but is too small for most purposes, principally used for plough shares and naves of wheels.

20 Lagerstrœmia microcarpa, *Salicarieæ*. Icon, 1169, Venteak, ven bugum ? Cutchay cuttay marum, Tam. This tree attains a large size and for common purposes, where timber of inferior quality is sufficient, is very useful being easily worked. Tested by the scale it only bore 290 lbs., on a second trial however it sustained 374 lbs. were it more strong and durable the length and straightness of the stem would adapt it for spars.

21 Dalbergia sessoides. *Leguminosæ*. Eatty or vitty marum, Tam. This is perhaps the best known in our jungles of the trees yielding black wood, but there are several others as good or perhaps better. It abounds in the Palghaut forests but is rarely met with now of great size, when it and its congener Dalb. latifolia are carried to Madras it becomes one of the rose woods of the furniture shops.

22 Ficus T'siela Roxb. *Moreæ*, Icon. 668. Eichie marum, Tam. I presume, like all the other species of ficus this is of very little value as timber, the people here know nothing of it.

23 Eriodendron anfractuosum, *Bombaceæ*, Icon. 400. Elavum marum, Tam. A soft, almost worthless wood, used by Mootchee men for making toys, and such like purposes.

24 Bassia longifolia. *Sapotaceæ*, Ill. 147. Elooppæ marum, Tam. A light coloured hard and durable wood nearly equal in these respects to teak, but much smaller. Here it is much used in the construction of carts, where great strength is called for. In Malabar, where it attains a large size, it is used for spars.

Enny curray marum. See Curry vaimboo.

25 Dalbergia latifolia. *Leguminosæ*. Icon. 1156. Erooppoottoo marum. Tam. This tree seems less abundant here than the eatty marum, perhaps from being more sought after as yielding more valuable timber; it is very dark, heavy and strong, sustaining a weight of 515 lbs.

26 Inga xylocarpa. *Mimoseæ*. Roxb. c. 100. Eroovaloo marum, Tam. A dark coloured, hard and very strong wood, excellent for naves of wheels and indeed for all purposes demanding great strength, I believe it is abundant in the Walliar forests. An inch bar sustained 550 lbs

Kaduki marum. Tam. See pillay murdah.

27 Euphorbia Tirucalli. *Euphorbaiceæ*. Kulli (milk hedge.) Tam. I have never seen this wood used, but have often heard it spoken of as excellent for gun stocks. To me it seems too light coloured.

28 Atalantia monophylla. *Aurantiaceæ*, Icon. 161, Kat yelloo mitch marum, Tam. A small sized tree, wood white, very fine and close-grained, and but for its want of size well adapted for cabinet purposes.

29 Limonia alata. *Aurantiaceæ*, Ill. 41. Kat yelloo mitch marum. Tam. Tree small but the wood is remarkably close grained, hard and heavy. It is a pale yellow or straw coloured, if procurable of adequate size would be very valuable.

30 Casearia elliptica. *Samydeæ*. Klaare marum. Tam, This is a large shrub rather than a tree, the wood therefore can be of little value except for ornamental purposes. It is smooth, fine grained and yellow coloured.

31 Cassia fistula, *Leguminosæ*. Koannay marum, Tam. On the Eastern side of the ghauts, a small tree of great beauty when in flower, but too small to yield useful timber; in the Malabar forests, however, it attains sufficient size to adapt it for spars for native vessels. The wood, which is close grained, is used for making tomtoms, &c.

32 Zizyphus Œnoplia, *Rhamneæ*, Koattay marum. Tam. Specimens of this were brought as belonging to the class of timbers; but if used at all, it can only be for small ornamental work.

33 Eugenia jambolanum. *Myrtaceæ*: Icon. 535. Koattay naga marum, Tam. Of this wood I have no knowledge, it is said to be brittle and bad, but is described by Ainslie as fit for house building purposes.

34 Chloroxylon swietenia. *Cedre'aceæ*, Ill. 56 bis. Kodawah porsh, Tam. This is the satin wood, so highly esteemed in Ceylon where it attains a large size. Until very lately I have never seen it exceed a good sized shrub in India. I have now planks 15 inches broad from the Annaimmully. The wood is very close grained, takes a fine polish and is fit for all kinds of ornamental purposes. In Ceylon where it is abundant and well known, it is very highly esteemed. Their shell boxes are made of it.

Kola murdah. See villay murdah.

35 Premna tomentosa. *Verbenaceæ*, Icon. 1468. Kolcuttay Teak marum, Tam. A small tree, the wood hard and close grained, of a brownish yellow colour, well fitted for ornamental purposes.

36. Holarrhena Codaga. *Apocyneæ*, Icon. 1292. Kooda pallei marum, Tam. A white small sized wood but very fine grained, employed in cabinet-making.

37 Gmelina asiatica. *Verbenaceæ* Ill. 174. Koomsla, maram Tam. This scarcely merits a place in this list, at least so far as I have ever seen it. The plant rarely attains the size of even a large shrub.

38 Zizyphus glabrata. *Rhamneæ*, Icon. 282. Kurkatta marum, Tam. A moderate sized tree but the timber excellent, hard, close grained and takes an excellent polish. It is of a light brownish colour. I have recently seen trees that would give 12 inch planks.

36 Mangifera Indica. *Terebinthaceæ* Maah marum, Tam. This timber seems but little used here and no wonder, since so many much better kinds are to be had for the cutting and fetching.

40 Mimusops elengi. *Sapotaceæ*, Icon. 1589. Maghidam marum, Tam. The quality of the

wood is unknown to me, and, being so much a cultivated plant, it is not probable that it is much used and is therefore little known.

41 Melia azadirachta. *Meliaceæ*, Icon. 160. Malay vaimboo marum, Tam. A soft reddish coloured, rather loose textured wood, which however takes a pretty good polish, and is much used here for cabinet-making purposes, under the name of bastard cedar.

Malay kongie (See 129 end of list) here.

42 Bauhinia acuminata. *Leguminosæ*. Mandareh, Tam. This is the B. candida Ainslie, which some botanists think a variety of koochnal (B. variegata) a larger and more common tree; both are rare here and I am not acquainted with the quality of the wood.

43 Terminalia alata (Ainslie), Terminalia tomentosa Roxb. *Combretaceæ*, Icon 195. Marudam marum, Tam. A large and useful timber tree, employed on the coast for house building and making canoes. I have not seen it in use here, it only differs externally from curry murdah in being hairy, so that the same plate serves for both species.

44 Randea dumetorum. *Rubiaceæ*, Icon. 580. Madoocarray marum, Tam. This seldom exceeds the size of a large shrub and therefore scarcely merits notice here, the wood is hard and close grained. The fruit is used in Malabar to poison fish.

45 Cratœva Roxburghii. *Capparideæ*. Mavoolinga marum, Tam. This the Cratœva Tapia of Ainslie, not of Linnæus; I am unacquainted with the timber which Ainslie states to be used for many common purposes.

46 Briedelia spinosa? *Euphorbiaceæ*, Roxb. c. 171. Moolloo vengay marum, Tam. Wood not known here, though the tree is not uncommon and attains a considerable size in the alpine jungles.

47 Premna integrifolia. *Verbenaceæ*, Icon. 1469. Moonnay marum, Tam. A common but usually a small tree, so that the timber is only useful for common purposes.

48 Erythrina indica. *Leguminosæ*, Icon. 58. Moorkoo marum, Tam. The mootchie wood of the English; a large tree, but the wood soft and only fit for mootchie work.

49 Nauclea cordifolia. *Rubiaceæ*, Roxb. c. 53. Munja cadumbay or adumbay, Tam. A pretty, close grained, yellow wood, but soft. It is easily worked, attains a rather large size and is much used for common purposes, on trial it sustained a weight of 320 lbs.

50 Morinda citrifolia. *Rubiaceæ*. Munja pavuta marum, Tam. The wood of this tree is a deep brownish yellow and the roots are said to be used in dyeing. The quality of the wood, judging simply from the appearance, is little if at all inferior, to the preceding; but the tree is much smaller.

51 Hydnocarpus inebreans. *Flacourtianeæ*, Icon. 942. Murravuttay marum, Tam. A common tree on the west coast, not so in the Coimbatore jungles. The quality of the wood is unknown to me.

52 Ehretia ovalifolia. *Borragineæ* 1383. Naraga marum, Tam. A common but generally small tree in the Coimbatore district. I am still unacquainted with the quality of the timber said to be useless.

53 Cordea Rothii, Icon, 1379. Cordea obliqua, Icon. 1378. Cordea fulvosa, Icon. 1380. *Borragineæ*. Narvillie marum, Tam. This Tamool name seems to be applied indiscriminately to three or four species of the genus, so that it is impossible to say which is the one meant. Cordea obliqua, C. Rothii and C. fulvosa have all been brought to me under this name. I believe the wood of all is very inferior, the trees being usually small.

54 Terminalia catappa. *Combreteceæ*, Icon. 172. Nat vadom cottay marum, Tam. A beautiful tree which attains a large size in Malabar, where the wood is much esteemed, it is little known here, It is the Almond tree of the English so called with reference to the shape of the fruit, oval and flattened, but the kernel is cylindrical.

55 Eugenia caryophyllefolium. *Myrtaceæ*, Icon. 553. Naurei narvillie or nawel marum, Tam. I suspect this is the same as koattay naga above 33. This is Ainslie's Calyptranthes caryophyllifolia, and his favorable account of the timber is such, as its appearance would lead one to expect.

56 Nauclea parviflora. *Rubiaceæ*, Ill. 123. Neer cuddembay marum, Tam. This is a strong fine grained timber, sustaining a weight of 400 lbs. Beams of considerable size are procurable. The wood is dark colored and close grained, but according to Roxburgh, soon rots if exposed to wet. From the fineness of its grain it seems well fitted for cabinet purposes, and has the advantage of being easily worked.

57 Antidesma alexiteria. *Antidesmeæ*. Nolhæ talie marum, Tam. A common enough jungle tree and a very handsome one, but I know nothing of the timber.

58 Morinda citrifolia *Rubiaceæ*. Nonna marum, Tam. This is the proper Tamool name for the munjee pavuttay, see above No. 50, *Morinda umbellata* is a climbing plant, and hence unfit for use as a timber, but has the same Tamool name.

59 Guatteria cerasoides. *Anonaceæ*, Roxb. C. 33. Noolœly marum, Tam. A moderate sized tree, wood white and close grained, at least as seen in a three or four years old branch, I have not seen it as it appears in the trunk.

60 Gardenia turgida? Nunjoonda marum, Tam. I only know this from small specimens, and am unable to say whether it is a tree or shrub, but believe the former; the wood which

is hard and close grained, is useful in cases where small timber will serve.

61 Balanetes Ægyptiaca. *Rutaceæ*, Icon. 274. Nunjoonda marum, Tam. A small tree, the wood is said to be only good for fuel. These 2 trees though sent to me under the same vernacular name, are most widely different, both as regards economical qualities and botanical characters and relations. I thence infer some mistake on the part of those who gave me these names.

62 Tectona ? Oomy takoo marum, Tam, I am as yet uncertain whether to view this as a variety or distinct species of teak. Specimens tested here proved very inferior in strength to the true teak, breaking with a weight of only 300 lbs., while the other sustained above 400.

63 Stereospermum suaveolens. *Bignoniaceæ*, Icon. 1341. Padrie marum, Tam. A considerable tree, frequent in the Walliar jungles, wood strong and elastic (said to be fitted for making bows), wood dark and good.

64 Artocarpus integrifolia. *Artocarpeæ*. Pillah or peela marum, (jack.) Tam. This is an excellent timber, at first yellow, but afterwards changing to brown, when made into tables and well kept, it soon attains a polish little inferior to mahogany.

65 Careya arborea. *Myrtaceæ*. Ill. 99, Pailæ marum, Tam. Wood said to be bad, the bark however furnishes a ready made cordage.

66 Wrightia tinctoria. *Apocynaceæ*, Icon. 444. Pallay marum, Tam. A common tree in the Coimbatore jungles, where it attains a considerable size, wood white and close grained; in the words of Roxb. "coming nearer to ivory than any I know." It is not however much in use here.

67 Calosanthes indica. *Bignoniaceæ*, Icon. 1337. Pana woodachie marum, Tam. Said to be a very soft and juicy wood, of no value.

68 Garcinia ? glutinifera. *Ainslie*. Panichekai marum, Tam. This is one of the very few trees admitted into this list that I have not myself seen and verified, and is introduced in the hope that some resident on the Malabar Coast, will favour me with specimens to determine its name and botanical relations.

69 Borassus flabelliformis, *Palmæ*. Panna marum, Tam. Old black wood of the palmira, is, next to that of Casuarina, the strongest I have seen tried; one specimen bore upwards of 700 lbs. and 5 of them gave an average of 648, though some were very bad.

70 Hymenodyction utile. *Rubiaceæ*, Icon 1156. Peroonjoly marum, Tam. When I first gathered specimens of this tree, I was informed that it furnished the wood called bastard cedar. This information if correct at all can only be partially so, as I have since found 2 others similarly reported, the tree attains a large size and the heart wood is red, but its qualities I have still to learn.

71 Ailanthus excelsa, *Zanthoxylaceæ*. Ill. 67, Peru marum, Tam. This tree resembles the ash in its general appearance and attains a large size The wood is said to be hard, close grained and heavy, fit for gun stocks. I am told that in Bombay it is much used in cabinet-making, but greatly doubt the correctness of this information.

72 Terminalia chebula, *Combretaceæ*. Pilla murdah marum, Tam. This is a most gigantic tree, furnishing planks 3 feet broad. It is a dark coloured, heavy and hard wood, but very cross grained and difficult to work. It sustained about 400 lbs.

73 Calophyllum inophyllum. *Guttiferæ*, Icon. 77. Pinnay or Poonnay marum, Tam. This tree is rare at this distance from the Coast, the wood is coarse grained, but very strong and durable, and on the Coast is used in ship building. In the alpine forests, it attains a great size and furnishes the poon spars so valuable for shipping; so far as I can learn, there are two or three species of calophyllum used for the same purpose under the general name of poon.

74 Dillenia pentagyna, *Dilleniaceæ*. Pinnay marum, Tam The similarity of native names between this and calophyllum inophyllum leads me to suspect some mistake here. The wood of Dillenia pentagyna is said to be exceedingly strong and very durable even when buried under ground, but as I have not yet succeeded in getting specimens, I cannot venture to offer any opinion either as to the probability of this conjecture or the quality of the timber, which I might have done, had I seen and examined a good sample. Since this paper was written, says Dr. Wight, I have been informed that this, not the preceding, is the tree that furnishes the Poon spars, and judging from the manner of growth of the two trees I feel satisfied that this information is correct. This is a tall, the other a short stumted tree.

75. Sapindus emarginatus, *Sapindaceæ*. Poocha cottay marum, Tam, I suspect this is the same as Roxb. S. detergens. The fruit is used for the same puposes as indicated by the characteristic native name. His S. emarginatus may be a different plant as the fruit does not correspond. I do not know the wood further than that it is white, said to be only fit for fuel.

76 Bombax malabaricum. *Bombaceæ*, Ill 26. Poola marum, Tam. A large tree, but the timber soft and watery, of no value, scarcely fit even for fuel.

77 Tamarindus indica. *Leguminosæ*, Poolia marum, Tam. The wood of this well known tree is little used, perhaps from its liability to become hollow in the centre, so as to prevent good planks being obtained, it is hard, durable and finely veined.

78 Pongamia glabra, *Leguminosæ*. Icon, Poonga marum, Tam. Wood said here to be only

fit for fuel, Roxburgh on the contrary states that it serves for a variety of purposes. An oil is expressed from the seed.

79 Thespesia populnea, *Malvaceæ*. Icon. 8, Poorsung kai marum, Tam. A strong, hard, and durable timber, but rarely to be met with good, owing to the trees rotting in the heart, it grows best near the Coast.

80 Schleichera trijuga. *Sapindaceæ*. Poovoo or poo marum, Tam. Red strong hard wood, generally rather small, used to make pestles, spokes for bandy wheels and such purpose, where much strength in small space is required.

81 Nephelium longanum. *Sapindaceæ*. Poovutty marum. A moderate sized tree having a straight trunk and fine globular head. The wood is white, hard and close grained, but the carpenters here seem to be unacquainted with it.

82 Butea frondosa. *Leguminosæ* Roxb. c. 21. Porasum marum. Tam. I can get no information regarding the wood, but Roxburgh gives some most interesting information regarding the juices of the tree, as a dye and water colour.

83 Dalbergia paniculata. *Leguminosæ*, Roxb. c. 114 Putchalay marum. Tam. This tree attains a considerable size, but I am as yet unacquainted with the timber. It is said to be strong and being of considerable size, is fit for many purposes.

84 Prosopis spicigera. *Mimoseæ*, Roxb, c. 63. Purrembay marum. Tam. This tree attains a considerable size and the timber is strong and hard, used for bandy wheels and other common purposes. A specimen of this wood supported 592 lbs. Is it the same as the vunny marum? The botanical specimens which accompany both, belonged to Prosopis spicigera.

85 Spathodea arcuata. *Bignoniaceæ*. Icon. 1340 Rau-pallay-marum. A medium sized tree frequent in the Walliar jungles. I do not know the wood, but judging from its relations—padre and vadeni coorne, I infer it will be found good.

86 Grewia tiliæfolia. *Tiliaceæ*. Sadachoo or chaduchy marum. Tam. A considerable tree, the wood is soft and easily worked: useful for inferior building and common purposes; said to be unfit for cabinet purposes, for which in appearance it seems well adapted, on account of its hygrometric properties, which causes it to contract and expand, however well seasoned, with every change of the weather.

87 Myristica cinerea? *Myristiceæ*. Saudikai marum. Tam. A tall straight coloured, close, even grained apparently of fine quality.

Sauvady marum. See vadencoornie.

88. Pterocarpus santalinus, *Leguminosæ*. Segapoo Shandanum marum, Tam. I do not know the wood of this tree. It is brought to Coimbatore, in small quantites, from Mysore, and sells at an extravagant price (by weight) as a dye wood. It is certainly a congener of the Vengay which furnishes much of the Malabar Kino, the texture of both is the same, the colour only differs.

89 Acacia odoratissima. *Mimoseæ*, Roxb. c. 120. Sela yoonja marum, Tam. Perhaps there is some mistake in the native name. The specimens which accompany it, are those of acacia odoratissima (curray vaugy) and may not represent the true sela yoonja.

90 Elæodendron Roxburghii. *Celastrineæ*, Ill. 71, Seloopa marum, Tam. This tree is more remarkable for its fine form than the length and thickness of its bole, I do not know the wood, but if good, can only be fit for cabinet making and small sized objects.

91 Cinnamomum iners, Nees. *Laurineæ*, Icon. 122. bis, Sembela or pooli pilla, Tam. A tall tree, rather slender in proportion to its height. The wood is fine, even grained and supposed very good, but apparently has never been used by the carpenters here, as none of them are acquainted with it.

92 Sethia indica *Erythroxyleæ*, Ill. 48, Roxb. c. 88 Semboolinja marum, Tam. This I believe is the *Erythroxylon areolatum* of Ainslie, when largest it is still but a small tree. Ainslie states that the wood is so fragrant, that it is used in Mysore as a substitute for sandal wood,

93 Canthium parviflorum, *Rubiaceæ*, Roxb, c. 51, Sengaray marum, Tam. A small tree or rather moderate size shrub wood, close grained and hard, well fitted for turning small objects.

94 Santalum album, *Santalaceæ*. Roxb, C. Shandanum marum, Tam. This very valuable wood is found in abundance on the Hills which separate this district from Mysore, whence it is brought to Coimbatore for sale, its uses are too well known to require notice.

95 Semicarpus anacardium. *Terebinthaceæ*, Roxb. c. 12. Shayng cottay marum. Tam. The juice of this tree is so acrid, that wood cutters wont cut it until after it has been killed by ringing the bark. Wood reported of no value.

96 Soymeda febrifuga. *Cedrelaceæ*, Roxb. c. 17. Shem marum. This is another name for the Choar Kullie.

97 Michelia Nilagirica, *Magnoliaceæ*. Ill' 5. Icon, 938, Shemboogha marum, Tam. This tree is rare in the Walliar forests, being alpine in its tendencies. It is common on the Neilgherries, wood said to be good as regards strength, but too highly hygrometrical to be useful in other form than rafters or beams, though close and fine grained,

98 Strychnos potatorum, *Loganiaceæ*. Roxb, c, 5, Ill, 156. Taita marum, Tam. The fruit of this is the well known clearing nut. It forms a moderate sized tree, but I am not aware of the wood being used.

99 Terminalia belerica. *Combretaceæ*, Ill. 91. Roxb. c. 198. Tanikai marum or tonda marum. A large tree, wood white and soft, said by Roxburgh to be durable, but not much used. In

Malabar it is hollowed out for canoes, which however are said not to be lasting. It is not uncommon in the Walliar jungles but is considered of no value there. Perhaps the tree so called in Malabar is the Terminalia Berryi, which also attains a large size, and is more nearly allied to the Curry-murdah, as belonging to the same section of the genus,

100 Tectona grandis. *Verbenaceæ*, Roxb. c, 6, Teak marum, Tam. This is the well known and far famed teak. As regards the strength, as shown by the weight it is capable of sustaining, it is inferior to several others tried here. The average of 6 specimens was about, but under 400 lbs.

101 Capparis divaricata, *Capparideæ*. Icon. 889. Toarattie marum, Tam. A small sized tree, wood only fit for fuel.

102 Diospyros melanoxylon. *Ebenaceæ*, Roxb, c, 46, *Toombie* marum (ebony). A very large tree, only the very heart of which is black, all the rest white. The white wood is however used for common purposes.

103 Cedrela toona. *Cedrelaceæ*. Roxb. c. 238. Icon 161. Toona or toon marum, Tam. A valuable timber tree of large size, wood reddish coloured, used for cabinet-making purposes. It, or an allied species, is known here under the name of Wunjoolie marum, which see.

104 Cæsalpinia sappan, *Leguminosæ*, Roxb. c. 19, T'siapangum, Tam. Only used for dyeing. It is cultivated in Palghaut for the purpose of dyeing the straw used in mat making.

Ulloombul marum. See. Vadencoornie,

105 Dichrostachys cinerea. *Mimoseæ*, Roxb. c. 174. Vadatala marum, Tam. A small tree or rather large shrub, wood very hard and strong but too small for any except common purposes.

106 Bignonia xylocarpa. *Bignoniaceæ*, Icon. 1335-36, Vadencoornie marum, Tam. A large tree, wood brownish yellow, rather close grained, employed for cabinet-making, takes a good polish in turning.

107 Feronia elephantum, *Aurantiaceæ* Roxb. c. 141. Vaila marum, Tam. This is the wood apple. The tree attains a large size and the wood is hard and durable, the only specimen tried here bore 360 lbs.

108 Azadirachta indica, *Meliaceæ*, Icon. 17, Vaypum marum, Tam. A generally diffused tree, the wood compact and durable, used for making cart wheels, &c.

109 Vachellia farnesiana. *Mimoseæ*, Icon. 300. Veda vully marum, Tam. Deficient in size, in other respects good.

110 Stereospermum chelonoides. *Bignoniaceæ*, Icon. 1341. Vela pauthrie marum, Tam. Usually pronounced padrie marum, the flowers are very fragrant, and the tree a very handsome one, though not large. It is probable there is some confusion in the specimens, as the proper padrie marum is reddish, and this is called the white padrie, though the specimens seem to be the same as the other. This may easily happen as the trees are very like, being principally distinguished by the colour of the flowers, yellowish on this, brownish purple in that. Hence, perhaps, the two names, black and white pautherie. This is said to be stronger wood of the two.

111 Terminalia Berryi. *Combretaceæ*. Vellay murdah marum, Tam. This, judging from some introduced plants growing in Coimbatore, is a very large tree. The bark is quite smooth, and nearly as green as the leaves. The wood is white described as of ordinary quality, used on the Coast for canoes, and is used for making the broad wooden platters in use among fishermen and ship lascars.

112 Conocarpus latifolia. *Combretaceæ*, Icon. 994. Vellay naga marum, Tam. A tall handsome tree furnishing an excellent and very strong timber. The specimens tried here though not the best, sustained 500 lbs. Roxburgh speaks of it in very high terms.

113 Sterculea urens. *Byttneriaceæ*, Roxb. c. 24. Vellay pootallie marum, Tam. The wood of this very large tree is soft and loose grained, only fit for the most common purposes. The leaves when soaked in water have the property of rendering it ropy and glutinous. The bark yields a gum resembling gum tragacanth.

114 Capparis grandis. *Capparideæ*, Icon. 21. Vellay toarattie marum, Tam. A small tree, but the wood is close grained and hard, too small for general use.

115. Acacia leucophlœa. *Mimoseæ*, Roxb. c. 150. Vel vaila marum. A strong dark coloured wood, but generally rather small. The tree attains a medium size with a fine round head. The bark is a pale yellowish colour whence the specific name "leucophlœa."

116. Acacia speciosa or flexuosa. *Mimoseæ*. Vel vaugay marum. A common tree, frequent by road sides on account of the shade its large head affords. The wood is white at least as compared with the kurry vaugay, but is very strong and durable: in our trials it bore 560 lbs.

117. Pterocarpus marsupium. *Leguminosæ*. Roxb. c. 116. Vengay marum. A large and very beautiful tree, especially when in flower, the wood is dark coloured and strong, sustaining a weight of 370 to 400 lbs., but it is said to require being kept dry. It gives out to wet lime (white wash for example) a dark rusty brown colour which deteriorates it for house building. It yields a resinous substance which is collected in large quantities in Malabar and sent to England under the name of Kino.

118. Lagerstrœmea microcarpa. Ventekoo marum. Another name for cutchay cuttay, which see.

119. Ægle marmalos. *Aurantiaceæ*, Icon. 16, Roxb. c. 143. Vilva marum, Tam. Wood said to be of no value which seems unlikely to be true

as it belongs to a family (the orange tribe) which is remarkable for excellence of its timber, barring its size, which is usually rather small.

120. Nerium antidysentericum. *Apocynaceæ.* Veppalei marum, Tam. I take this name from Ainslie, but suspect it is another name for Kooda pallie, (which see) the Linnæan name belonging to a Ceylon plant, which I have not seen on the continent. The wood is said to be excellent for cabinet making purposes.

121 Diospyros cordifolia. *Ebenaceæ*, Roxb. c. 50, Ill. 148, Vuckana marum, Tam. A hard heavy wood, colour brown, said to be very strong, but difficult to work.

122. Prosopis spicigera ? *Mimoseæ*, Roxb. c, 63. Vunny marum. Tam. The specimens brought to me under this name were not in flower, but seem quite identical with those of the purrembay; this therefore is I believe the Tamool, the other the Malayalum name. The wood, if I have not mistaken the species, is very strong (sustaining nearly 600 lbs., is hard, straight grained and easily worked), but it may be another name for curreugally, the foliage of which is very like that of Prosopis spicigera.

123 Cluytea collina. *Euphorbiaceæ*, Roxb. c. 169, Woadoogoo marum. Tam. A small tree, frequent in the Walliar jungles: wood red coloured, exceedingly hard and durable but of small size: notwithstanding its hardness, being very even grained, it is easily worked, and is from its fine close grain a pretty wood.

124 Acacia catechu. *Mimoseæ*, Roxb. c. 175, Wodahalay marum, Tam. Said to be only fit for fuel. This surprises me as the woods of all the other arboreous species of the order (Mimoseæ) are proverbial for their excellence.

125 Acacia amara. *Mimoseæ*, Roxb, c, 122. Woonja marum, Tam. A pretty large tree, but of rather low stature: the wood dark coloured and hard. I have not yet had an opportunity of properly examining it.

126 Cedrela toona. *Cedrelaceæ*, Icon, 161, Wunjoolie marum. A very heavy and strong wood, hard, said to be admirably fitted for pestles and mortars and other purposes demanding great strength, but not for cabinet purposes; whence I suspect Roxburgh's toona and our Wunjoolie are different trees.

127 Zizyphus jujuba, *Rhamneæ*, Icon. 93, Yellanday marum, Tam. Tree usually of small size, but the wood fine grained and hard, fitted for cabinet-making purposes.

128 Strychnos nux vomica, Roxb, c, 4 *Loganiaceæ*, Icon, 434, Yetti marum, Tam. A small tree, wood white and hard, much used, when procurable, for Native plough shares.

129 Cullenea excelsa, *Bombaceæ*, 1761, Malay konjie marum, Tam. A very large and tall tree, trunk straight, from 60 to 80 feet high. Wood white, rather open grained, apparently not very good, but the outside sap-wood only was examined. Under the microscope its longitudinal section is very peculiar; altogether such as I have not elsewhere observed,

130 Rhus?—Sp? *Terebinthaceæ*. Coongilliya marum, Tam. This is the chloroxylon dupada of Buchanan and Ainslie. An undescribed name and judging from the leaves, one not required, which are clearly those of a rhus very nearly allied to Roxburgh's R. Bucki-amela but distinct. The qualities of the timber is unknown. The outer sap-wood is white, fine grained and heavy, apparently very good.

131. Vitex altissima. *Verbenaceæ*, Icon. 1466 Kat miella marum. This is a large tree, frequent on the lower slopes of the ghaut mountains, but I am not acquainted with the timber except in so far as can be learned from a small outside specimen which seems close grained. It is reported fit for cabinet purposes.

132 Canthium nitens? *Rubiaceæ*. Malay cauray, Tam. The wood of this, like that of the preceding, is unknown to me. The plant is described as a small tree. I only know it from the specimens which accompanied the name, but which were not accompanied with timber.

133 Hymenodyction obovatum. Icon 1159, Yella malakai marum, Tam. A tree, but I am unacquainted with its dimensions or quality of the wood; no specimens having been sent.—*Robert Wight.*

(8201) *Ganjam, Goomsoor, and Kimedy Forests, their timber trees, Timbers and Fancy-woods.*

Several lists of the trees of these forests are in our possession, but the most recent and valuable are from Lieutenant Macdonald from Ganjam and Lieut. Philipps from Kimmedy. In a memorandum which accompanied the list of Ganjam woods it is mentioned that the forests in the northern portion of the district of Ganjam, although not to be compared in size or importance with those in some other parts of the Madras Presidency are nevertheless somewhat extensive and contain many useful trees.

The most important and accessible of these forests are situated in the talook of Goomsur and the Zemindary of Bodogoda both of which are watered by rivers which afford facilities for floating the timber down to the coast during the freshes. The Jungles change their names every two or three miles and a list of them would be so long that it seems sufficient to indicate in general terms the localities in which the largest and finest timber is procurable. In Goomsur these are the Kookooloobah, Gullery, Ootorogodoloto, Poorwagoodoloto, Juggurnauthprasaud, Kurcholy, Bhootapilly and Beerecota Mootahs. In Bodogoda there are three Mootahs below the Ghauts, the Coradakonna, Godo and Jagiree, all three of which are well wooded, but the first contains the largest forests. Above the

ghauts are the Mootahs of Jorraow, Gowdogotho, Morihano, Gokalopoor, Meerecote, Woddobah and Lohagooddee all abounding in timber, which remains uncut chiefly on account of the difficulty of transporting it.

The same remark applies to the forests of Chokapaud and Poomaghur, two hill dependencies of Goomsur. In the former the Cottarikiah, Woollingiah, Mettribiah and Koondopottro Mootahs contain forests which are of little use to any one except the inhabitants of the country —of these forests the largest are the Dodosoroo, Dehenkosoroo, Jhoondasoroo and Saboolodeyee. In the Hill tracts under Poomaghur for the same reason, but little use is made of any of the forests with the exception of those in the Punchagodotolo Mootah which lies at the foot of the ghauts.

I am not in possession of any returns from Soorada, but I know from personal observation that this small talook is most extensively wooded and that it supplies large quantities of fire-wood to the Aska factory, the sum paid for this single item being, I have been given to understand, equal to one third of the revenue collected from the Talook. It is noted for its extensive tamarind topes and orange groves but in other respects probably differs but little from the neighbouring talooks.

Bodogoda is a Zemindary but the Rajah being a minor is at present under the management of Government. The forests belong to the Zemindar, in whose name a variety of small taxes are levied on the products of the jungle. Their amount is however very insignificant and the privilege of collecting them is farmed out to a renter who is styled "Ghoto Bissoye," "Bono Bissoye" and "Bono borilla," (Jungle-ranger), which last name is expressive of the nature of his ordinary duty. He paid this year Rupees 84 for his farm and levies a small sum varying from 4 annas to a Rupee from each village for the general privilege of cutting fire-wood, a tax of 2 annas on every new bandy, of one Rupee on every new boat, of R. 1-8-0 on every tree cut down for a mast, half an anna on every bandy load of fire-wood, 1 anna on every bandy load of bamboos, 2 annas and 6 pice on every bandy load of plank wood, and similar small sums for wood required for ploughshares, oil presses &c. There is also a Zemindary tax termed Pohondee Ghuttum, levied on all sales of honey, rosin, Arrow root, Moholo flowers, Moholo seeds, and Korunjo seeds, but in Bodogoda this tax has apparently merged in the farm of the forest renter.

In Goomsur and the other tracts alluded to, which are all Government talooks, no such taxes are known, and although the forests are almost without exception, Government property, no revenue whatever is derived from them. In the time of the Goomsur Rajahs, it is said that a tax called Bono Cowry of 2 annas was levied on each plough, and that altogether the forests yielded a revenue of about Rupees 2000 a year, but these taxes have been abolished.

Throughout the whole of this part of the District, there is far more timber than is required for the local consumption, but there is no doubt that with the exception of the Hill Tracts, the jungles are all rapidly diminishing—partly owing to the increase of cultivation and partly to meet the demand for timber at Aska, Berhampore, Ganjam and other places. In the time of the Rajahs the felling of timber was systematically discouraged from motives of policy with a view to render the country less accessible to troops. With the exception of an order recently issued by the Collector forbidding the indiscriminate cutting of timber there is at present no system of any kind regarding the felling or the reproduction of trees.

Timber is cut at all times of the year, but most of it seems to be felled between January and May, these being the months during which the Ryots are less occupied with their cultivation. Bamboos and other trees which have little or no heart wood, are cut during the wane of the moon being otherwise, it is said, liable to be attacked by insects, but there is no such belief with regard to the larger kinds of timber. There are however five days in each Hindoo month, which are supposed to be inauspicious and on these no trees are felled.

Large patches of jungle are constantly cleared for the purpose of being brought under cultivation and the destruction of the trees is often, and on the hills it may be said always, effected by fire. This destruction is however not altogether indiscriminate, certain trees being always carefully preserved. Among these are the Mango and date tree, the koeto, the Bovadah and Soondorogoondee, to which, if the cultivators are Khonds, may be added the Solopo palm and the Mohollo, which are especially reserved from destruction on account of the intoxicating liquors which they yield.

Annexed is an imperfect list of the forest trees in this part of the country with their dimensions and remarks on the use to which they are generally applied, followed by a list of the prices of timber and other vegetable products. None of these seem to be subject to any kind of regulation, and it has not been possible to ascertain the extent of traffic which is carried on in them. No exotic trees of any kind have as yet been introduced.

The wild Animals of the country are tigers, black panthers, common panthers, cheetahs, hyenas, jungle cats, bears, elk, spotted deer, bison, neelghye, wild hog, jungle sheep,

wild dogs, porcupines, hog deer, and two kinds of monkeys.

R. M. MACDONALD,
Assistant Agent

Asst. Agent's Office, Russellcondah, 4th Dec. 1854.

Lieutenant Phillips believes that the Kimedy forests cover to the extent of 400 square miles, those of chief consequence and most accessible, lying on both banks of the Vremshadara river, above and below "Butteley," "Barsinghy," Jeranghee; Jeranghe, Giba, Cothoor, Jadoupully and indeed the whole of the hilly tracts abound with fine trees, the only difficulty being their removal when cut. He particularly notices a tree, the "Dhamono," or "*Kurkurra.*" Its extreme height is 39 feet. The circumference its trunk is 8½ feet, and height from the ground to nearest branch 18 feet. It furnishes a very long grained tough wood, plant and light. It is used for dhoolies, cots, bandy wheels, and poles, spear and axe handles, fishing rods and lance handles and other purposes where strength and elasticity are required.

(8202) *Ganjam and Goomsoor.*

1 Salwa or Sorunghee. Extreme height 90 feet. Circumference 6 feet. Height from ground to the intersection of the first branch, 33—38 feet. This is the well known saul or dammer tree and is one of the commonest as well as one of the most useful trees in these jungles. It is used for beams, rafters, posts and for almost every description of wood work required in house building; it is made into masts for native dhonies, is used for bandy wheels and ploughshares and has recently been exported in large quantities to supply the demand for Railway sleepers. The large logs are cut into planks for doors, windows and other purposes. The branches and less useful portions of the tree are burnt for firewood and for charcoal. The tree before being used is usually stripped of its bark; it is then designated Jhora or Jhangherree and is not liable to be attacked by white ants. A well known rosin (bdellium.) termed here Jhoona or sodaloso exudes from the tree when it has attained a large size. This is burnt at the shrines of all the Village goddesses, is used by native jewellers for filling up the hollow portions of ornaments, and is in great request among ship owners and boatmen for their vessels. The leaves of this tree are used for eating rice out of. The seeds are used medicinally and are said to have an astringent property. They are also boiled, dried and pounded into a sort of rice, which is eaten by the Khonds and poorer classes of Oriyas in times of scarcity. This tree abounds every where, the largest specimens are to be found in the Goomsur forests, but the timber of Bodogoda appears to be more highly prized in the native market, not, it is said on account of any intrinsic superiority in the wood, but because large quantities of a uniform size are more easily procurable in that zemindary It forms an important article of traffic in Bodogoda, large quantities of it being annually floated during the rains down the Jhoroo and the Patna towards Soorada, and thence, after the junction of these streams with the Kooshkoolliah to Aska, Pitala and Ganjam, besides which a considerable quantity of timber is carried on bandies to Shergoda, Coorlah and Berhampore.

2 Piasalo. Teriminalia alata. Buchananii latifolia. Extreme height 90 feet. Circumference 6 feet. Height from ground to the intersection of the first branch, 22 feet. This is also a most useful wood and is in great request for doors, windows, boxes and also for house building. It is also used for the flooring of cattle sheds. The supply is hardly equal to the demand and the tree is getting scarcer than it was

3 Sisoowa. Dalbergia sissoo Extreme heigh 45 feet. Circumference 4½ feet. Height from ground to the intersection of the first branch, 1 feet. This is the material of which tables, chairs couches, bookstands and other articles of furniture are usually made in this part of the country. It i not so plentiful as it was being in great request The wood yields a very useful oil.

4 Kendhoo. Extreme height 60 feet. Circumference 4½ feet. Height from ground to the intersection of the first branch, 30 feet. A hard wood blacker than the Sisoowa. Boxes &c are made of it. It is tolerably common. The fruit is eaten.

5 Gombharee. Extreme height 50 feet. Circumference 4½ feet. Height from ground to the intersection of the first branch, 1 feet. A white light wood. Boxes, chairs, bed posts, lamp stands, bullock yokes, bazar measures, toys and other articles are made of it. I is rather scarce and expensive. The bark i said to be used medicinally.

6 Holondho ? Extreme height 75 feet. Circumference 7 feet. Height from ground to the intersection of the first branch, 36 feet. This wood on account of its size and lightness is used for boats which are made of a single log of it by simply scooping out the inside and afterwards shapened in a rough manner. It is also used for the masts of native Dhoneys, and bazar measures, and is cut into planks and made into doors, boxes &c. It is getting scarcer than it was but is still tolerably common

7 Jamo Myrtus cyminum ? Eugenia Jamboo ? Eugenia Jambolana. Extreme height 7 feet. Circumference 7 feet. Height from ground to the intersection of the first branch, 36 feet This is also used for making boats in the same way as the Holondho. Doors, ploughshare and troughs for cattle are made of it. The fruit is eaten. The bark is used medicinally i diarrhœa &c. The tree is not very common either

in Bodogoda or lower Goomsur, but is said to be rather plentiful in the Chokapaud forests. There are two species termed respectively the "Bodo" and "Coojee" Jamo.

8 Sohn. Coronilla sesban? Coronilla picta? Extreme height 50 feet. Circumference 6 feet. Height from ground to the intersection of the first branch, 12 feet. A very heavy wood and of great strength. It is almost exclusively reserved for making posts for pagodas and sacred edifices, the use of it in ordinary house building being it is said forbidden in the shastras. The tree is very common, but owing to this superstition very little use is made of it, the only purposes to which the wood is applied being for making rice pounders and the wooden stands on which the large grain baskets used in this part of the country, are placed. The bark is used for tanning skins and also medicinally by women after childbirth, a sort of fungus or excresence from this tree is applied externally to wounds and sores and is also taken internally in colic and affections of the stomach.

9 Bodoka. Extreme height 35 feet. Circumference 3 feet. Height from ground to the intersection of the first branch, 15 feet. A light, white wood, used for scabbards, bazar measures, boxes, bullock yokes, the poles of palanquins and tonjins and for toys. It is tolerably common.

10 Ponoso. This is the common jack tree and does not therefore require to be described. It is not very plentiful.

11 Jhoontiah. Extreme height 45 feet. Circumference 4½ feet. Height from ground to the intersection of the first branch, 15 feet. A hard, white wood, used chiefly for making hair combs and small boxes. It is tolerably common.

12. Koossoomo. Extreme height 50 feet. Circumference, 4½ feet. Height from ground to the intersection of the first branch, 9 feet. A remarkably hard, heavy wood, and used on that account for oil presses, sugar crushers, and the axletrees of bandies. The tree yields a lac which is in request among native jewellers, an oil used for burning is extracted from the seeds. There are two species of this tree, the "Kola" and the "Ghuntiah" Koossoomo. The former abounds and is large and more useful than the other, which is not so common.

13. Moondomonde. Extreme height 60 feet. Circumference 4½ feet. Height from ground to the intersection of the first branch, 22 feet. This wood is used occasionally for beams, planks &c. but is not in much request and the tree is not very plentiful.

14. Orjoono. Terminalia alata? T. glabra? Extreme height 100 feet. Circumference 8 feet. Height from ground to the intersection of the first branch, 36 feet. This is used for making boats in the same way as the Holondho and Jamo. The tree is not very common in Goomsur but abounds in the forests of Bodogoda.

15. Mohoollo. Bassia latifolia? Extreme height 15 feet. Circumference 8 feet. Height from ground to the intersection of the first branch, 36 feet. This is also used for boats and the flooring of cattle sheds is often made of this wood, this tree is highly prized by the Hill tribes on account of the intoxicating liquor which they distil from its flower. The latter is made into a sort of sweetmeat by the Oriyas, who mix sugar and rice with it. The fruit in its unripe state is boiled and eaten as a vegetable. The fruit yields an oil termed "Jolo Jelo," this is purchased by the bukals for the purpose of adulterating ghee, which it somewhat resembles in appearance. This tree and the Solopo palm are never destroyed by the koonds when they clear a patch of jungle for the purpose of bringing it under cultivation, and in the time of the Goomsur Rajahs, the rebellion of any of the Hill tribes was often punished by cutting down all their Mohollo and Solopo trees.

16. Achoo. Extreme height 36 feet Circumference 2½ feet. Height from ground to the intersection of the first branch, 10 feet. A light, hard wood, of which the stocks of all the Oriya matchlocks is made. A pink dye is extracted from the root. It is not very common.

17. Ambo. This is the common mangoe tree and requires no description.

18. Kodalo. Extreme height 39 feet. Circumference 3 feet. Height from ground to the intersection of the first branch, 8 feet. A light wood used for planks, doors, boxes and scabbards; it is also used for firewood, being tolerably plentiful.

19. Mahalimbo. Extreme height 70 feet. Circumference 5 feet. Height from ground to the intersection of the first branch, 22 feet. This wood is not liable to be attacked by insects, and is on that account used for making boxes &c. The fruit and bark are used medicinally for fever and rheumatism. The tree is tolerably common.

20. Limbo. Melia Azedirachta? Extreme height 70 feet. Circumference 5 feet. Height from ground to the intersection of the first branch, 22 feet. This is the margosa tree. Idols are usually made of this wood because it is not liable to be attacked by insects. The bark is used medicinally for fever, small pox, and worms. An oil which is extracted from the seeds of this tree, is used for itch and other cutaneous diseases. The tree is tolerably common and is burnt for firewood.

21. Soroopottree Moee. Extreme height 40 feet. Circumference 2½ feet. Height from ground to the intersection of the first branch, 18 feet. Used for planks, doors, boxes, posts, and ploughshares. It is tolerably common.

22. Siddha. Extreme height 45 feet. Circum-

ference 4 feet. Height from ground to the intersection of the first branch, 22 feet. This wood is not liable to be attacked by insects. It is used chiefly for making rafters of and is burnt for firewood, being rather plentiful. The bark and leaves are employed in tanning leather and are also used medicinally.

23. Sahajo. Extreme height 60 feet. Circumference 4½ feet. Height from ground to the intersection of the first branch, 30 feet. This is one of the commonest trees in these jungles, Cattle sheds are sometimes floored with this wood and rice pounders are also said to be occasionally made of it, it is extensively used for firewood and for making potash. The bark is used for tanning.

24. Kaloochia. Extreme height 25 feet. Circumference 2½ feet. Height from ground to the intersection of the first branch, 12 feet. Used for posts and ploughshares and burnt for firewood. It is not a common tree.

25. Banjhono. Extreme height 45 feet. Circumference 5 feet. Height from ground to the intersection of the first branch, 22 feet. Used for bandy wheels on account of its strength. It is rather scarce.

26. Dhamono. Extreme height 35 feet. Circumference 3 feet. Height from ground to the intersection of the first branch, 20 feet. Used for cot frames and bandy wheels; the handles of axes, knives, spears, momoties, pickaxes and carpenter's tools are made of this wood, which is also burnt for firewood, being tolerably plentiful.

27. Kosee. Extreme height 50 feet. Circumference 4 feet. Height from ground to the intersection of the first branch, 22 feet. Used for posts, door frames and rafters and burnt for firewood, being tolerably plentiful.

28. Janghany. Cassia Auriculata? Extreme height 40 feet. Circumference 3 feet Height from ground to the intersection of the first branch, 18 feet. Used for posts and rafters, and burnt for firewood. It is tolerably common in Bodogoda, but seems to be scarce in Goomsur.

29. Goubarea. Extreme height 45 feet. Circumference 4½ feet. Height from ground to the intersection of the first branch, 15 feet. A wood of great strength and used on that account for sugar crushers, bandy wheels, ploughshares and rice pounders. The bark is used for tanning skins. The tree being tolerably common is burnt for firewood.

30. Pitta Kaloochia. Extreme height 36 feet. Circumference 3 feet. Height from ground to the intersection of the first branch, 15 feet. Used for the same purposes as the kaloochia (Vide No. 24) but is a larger tree and very plentiful.

31. Khoiro. Mimosa catechu? Extreme height 25 feet. Circumference 2 feet. Height from ground to the intersection of the first branch, 6 feet. Used on account of its strength for sugar presses, and rice pounders. The wood is burnt when libations are offered. The gum is mixed with betel nut and gives a red colour to the spittle. This is I believe generally known under the name of Catechu.

32. Dhobo Khoiro. Extreme height 25 feet. Circumference 2 feet. Height from ground to the intersection of the first branch, 6 feet. A white variety of the same species. Both trees are very common.

33. Minjharee or Paloodhona. Extreme height 45 feet. Circumference 5 feet. Height from ground to the intersection of the first branch, 6 feet. Used on account of its lightness for rafts also for pacottah poles. The fruit and flower are both eaten. The bark and leaves are used medicinally for worms. The tree abounds.

34 Tentoollee or Koyan. This is the common tamarind tree and calls for no remark.

35 Sirisee. Mimosa Serissa? Extreme height 30 feet. Circumference 4½ feet. Height from ground to the intersection of the first branch, 22 feet. Used for sugar crushers, pestles, mortars and ploughshares. It is tolerably plentiful.

36 Boro. This is the common banian tree and calls for no remark.

37 Phasee. Extreme height 60 feet. Circumference 6 feet. Height from ground to the intersection of the first branch, 30 feet. A light hard wood, used for sugar presses, rice pounders, and bandy wheels, and occasionally for making boats of. It is tolerably plentiful.

38 Oshrosto. This is the ficus religiosa and calls for no remark.

39 Dhoou, Extreme height 45 feet. Circumference 4½ feet. Height from ground to the intersection of the first branch, 22 feet. This tree abounds and is extensively used for fuel. The wood is of little value.

40 Koombee, Bauhinia spicata? Extreme height 36 feet. Circumference 3 feet. Height from ground to the intersection of the first branch, 6 feet. A light, white wood, used for bullock yokes. The common match used by the Oriya matchlock men is a rope made of the fibre taken from the bark of this tree; it is said to be used for this purpose because it burns for a long time. The scanty substitute for ordinary clothing used by Byragees. Visnovas and other persons affecting peculiar sanctity is made of the bark of this tree. It is said to be also used medicinally. The tree abounds.

41 Bouro. Bombax heptaphyllum. This is the common silk cotton tree and calls for no remark

42 Baelo. Extreme height 30 feet. Circumference 3 feet. Height from ground to the intersection of the first branch, 15 feet. This wood is sometimes employed for making bandies, but it is chiefly used for firewood the tree being extremely common, the leaves are used for making

a sort of umbrellah which is worn on the head by the ryots and coolies in this part of the country.

43 Soondorogoondee Koomalagoondee or Bosontogoondee Extreme height 15 feet. Circumference 2½ feet. Height from ground to the intersection of the first branch, 5 feet. The fruit of this tree yields a valuable dye which is extensively used for dyeing silk &c and is exported in large quantities to Calcutta and other places. It is very expensive and is eagerly bought up by the Mahajuns who send their Gumashtahs to purchase it of the Khonds. The tree is very scarce in many parts of Goomsur but is tolerably common in any of the frontier Mootahs such as Juggernathprasaud, Kurcholy and Coocooloobah. It is found in greater abundance in the Bodogodo Jungles, and is said to be tolerably plentiful about Chotapaud, but is far more common on the Bengal side of the frontier and is said to abound in Boad and Duspullah.

44 Korunjo. Galedupa arborea Extreme height 36 feet. Circumference 4½ feet. Height from ground to the intersection of the first branch, 22 feet. The tree is very common, but no use seems to be made of the wood except for firewood ; an oil extracted from the fruit is used medicinally for itch and other cutaneous diseases and is also employed as lamp oil.

45 Soogondhee Ocimum Caryophillatum? Periploca indica? Extreme height 25 feet. Circumference 2 feet. Height from ground to the intersection of the first branch, 7 feet. This tree is tolerably common but no use is made of the wood except for firewood, the leaves are used medicinally for rheumatism and wounds of long standing.

46 Bhayroo Swietenia chloroxylon. Extreme height 40 feet. Circumference 3 feet. Height from ground to the intersection of the first branch, 20 feet. Used for axletrees, oil presses, posts, bed posts, rafters and the handles of axes. It is also burnt for firewood, and for charcoal. The leaves are applied to wounds. The tree is not so common in Goomsur as in Bodo godo, and it is said to be still more plentiful in Mohery and other talooks to the South.

47 Bello. Ægle Marmelos. Extreme height 30 feet. Circumference 3 feet. Height from ground to the intersection of the first branch, 10 feet. The wood of this tree is mixed with water and ground into a sort of oily paste, which is poured on the lingum in the temples dedicated to Siva. The leaves are offered to Siva and to the female divinities in the same way that the leaves of the Toolsee are offered to Vishnoo. The fruit is eaten and the juice of it is used in making chunam.

48 Borokolee. Zizyphus jujuba. Extreme height 30 feet. Circumference 3 feet. Height from ground to the intersection of the first branch 8 feet. Planks, doors, boxes, matchlock stocks, and Palanquins are made of this wood. The leaves pounded and mixed with turmeric are supposed to be efficacious in curing rheumatism. The seeds are also used medicinally in diseases of infants. The tree yields a lac. The large trees are scarce but young trees are very common.

49 Ollakolee. Emblic Myrobalan Phylanthus Emblica. ? Extreme height 40 feet. Circumference 4 feet. Height from ground to the intersection of the first branch, 15 feet. No use seems to be made of this wood, but the fruit is pickled and the bark is used medicinally.

50 Moee. Extreme height 30 feet. Circumference 3 feet. Height from ground to the intersection of the first branch, 13 feet. Stakes are cut from this tree and planted in hedges where they spring up again. The bark is used in tanning leather. The tree abounds.

51 Behenta. Extreme height 30 feet. Circumference 3 feet. Height from ground to the intersection of the first branch, 10 feet. Used for Axletrees, oil presses and rice pounders. It is also burnt for fire-wood the tree being very common. The bark and leaves are used medicinally.

52 Korada. Extreme height 30 feet. Circumference 3 feet. Height from ground to the intersection of the first branch, 8 feet. A light wood, used for rafters, spinning wheels and door frames. It is also burnt for fire wood the tree being very common. The leaf is used medicinally for itch. The bark of this tree is poisonous and a preparation of it is often used for the purpose of destroying life, particularly by Oriya widows among whom suicide is a frequent occurrence.

53 Dhobee. Extreme height 36 feet. Circumference 3 feet. Height from gronnd to the intersection of the first branch, 15 feet. There are two species of this tree, the "Nongoliah" and the "Pooro," both of which are very common. It seems to be only used for firewood.

54 Charo. Buchanania latifolia. Extreme height 36 feet. Circumference 3 feet. Height from ground to the intersection of the first branch, 15 feet. This tree abounds. Bullock yokes are sometimes made of the wood, but it is chiefly used for firewood.

55 Poeechandea. Extreme height 48 feet. Circumference 5 feet. Height from ground to the intersection of the first branch, 9 feet. Ploughshares are occasionally made of this wood, but it is chiefly used for firewood. The rosaries worn by Byragees and Vishnoos are made of the seeds of this tree.

56 Grouhonee Kubatee. Extreme height 80 feet. Circumference 6 feet. Height from ground to the intersection of the first branch, 12 feet. The platform of the cars used at the Juggurnauth festival is often made of this wood, but it is chiefly used for firewood being

tolerably common. The bark is said to be used medicinally for diarrhœa.

57 Horedha. Terminalia Chebula ? Extreme height 45 feet. Circumference 4½ feet. Height from ground to the intersection of the first branch, 20 feet. Used occasionally for beams and rafters but chiefly for firewood, the tree being tolerably plentiful. The bark is said to be employed in tanning and the fruit to be used medicinally. The fruit yields a black dye.

58 Bahadha. Terminalia Belerica ? Extreme height 50 feet. Circumference 4 feet. Height from ground to the intersection of the first branch, 10 feet. A tolerably common tree but the wood is said to be of no use. The fruit is used medicinally.

59 Soonaree, Cassia fistula ? Extreme height 36 feet. Circumference 3 feet. Height from ground to the intersection of the first branch, 10 feet. A tolerably common tree. Ploughshares and rice pounders are occasionally made of this wood, but it is chiefly used for firewood. The fruit is used medicinally. Bears are particularly fond of it.

60 Bhalleah, Semecarpus Anacardium. Extreme height 40 feet. Circumference 4 feet, Height from ground to the intersection of the first branch, 20 feet. A tolerably common tree, but no use seems to be made of the wood except for firewood. The nuts are eaten—an oil extracted from the nuts is applied to the sores of cattle and also used for rheumatism. The fruit yields a black dye.

61 Dhimeree, Ficus glomerata ? Ficus guleria ? Extreme height 40 feet : Circumference 4½ feet Height from ground to the intersection of the first branch, 8 feet. Bandy wheels are sometimes made of the wood, but it is chiefly used for firewood, being tolerably plentiful. It is considered sacred and is burnt when libations are offered. The fruit is eaten : a juice extracted from the root is used for rheumatism.

62 Boincho Flacourtia sapida ? Extreme height 15 feet. Circumference 1 foot. Height from ground to the intersection of the first branch, 5 feet. A common tree only used for firewood. The fruit is eaten. This wood is burnt when libations are offered for a person who has died on an inauspicious day.

63 Choonokolee. Extreme height 10 feet. Circumference 1 foot. Height from ground to the intersection of the first branch, 5 feet. A common useless tree. The fruit is eaten.

64 Brahmonea. Extreme height 15 feet, Circumference 1½ feet. Height from ground to the intersection of the first branch, 7 feet. The bark is said to be used medicinally, but the wood is useless.

65 Sahadha, Trophis aspera ? Extreme height 30 feet. Circumference 2 feet. Height from ground to the intersection of the first branch, 6 feet. Bandy wheels and tooth brushes are sometimes made of this wood, but it is chiefly employed for firewood being very plentiful. The bark is used medicinally, the leaves and sap are used for wounds and for a disease of the eye termed in Oriya Jokia, said to be peculiar to children.

66 Gotho. Extreme height 20 feet. Circumference 2½ feet. Height from ground to the intersection of the first branch, 7 feet. Useless except for firewood.

67 Gondhona Phyllanthus emblica ? Extreme height 25 feet. Circumference 7½ feet. Height from ground to the intersection of the first branch, 6 feet. There are two varieties of this tree, termed respectively the " Gona" and the " Moirsea" Gondhona. The leaves are boiled and eaten as a vegetable. The bark is used medicinally. The common mode of obtaining fire in the jungle is by rubbing two pieces of this wood together. The tree is tolerably common, but the wood is only used for firewood.

68 Rayee. Extreme height 30 feet. Circumference 3 feet. Height from ground to the intersection of the first branch, 15 feet. Tolerably plentiful, but only used for firewood.

69 Ankoolo Alangium Hexapetalum ? Extreme height 30 feet. Circumference 2½ feet. Height from the ground to the intersection of the first branch, 12 feet. The leading bull in a herd of buffaloes has a sort of wooden bell called " Lodoko" attached to its neck. This is heard at a great distance in the Jungle and is always made of this wood, which is said to be peculiarly adapted for producing sounds. The wood seems however to be of no other use except for firewood. The root is used for snake bites.

70 Patonwa. Extreme height 20 feet. Circumference 1 foot. Height from ground to the intersection of the first branch, 5 feet. Used chiefly for firewood being tolerably common. The fruit thrown into a pond of water kills all the fish in it and is used for that purpose by the keyouts (fishermen). This mode of catching fish is designated " Macho Mohoneebaro." The fruit is said to be poisonous, but the seeds are used medicinally for fever.

71 Ambaleta. Extreme height 12 feet. Circumference 1½ feet. Height from ground to the intersection of the first branch, 3 feet. The juice of the leaves is mixed with Mercury and taken internally for rheumatism and other diseases.

72 Kotoko. Strychnos potatorum ? Extreme height 40 feet. Circumference 4 feet. Height from ground to the intersection of the first branch, 9 feet. Chiefly used for firewood, though bandy wheels and ploughshares are occasionally made of this wood. The seeds have the curious property of purifying muddy water, and are constantly used for that purpose by the natives who rub the inside of their lotas and brass pots with them. They are also used for killing fish in the same way as the fruit of the Potonwa. The fruit is used medicinally.

73 Porto koorwan. Extreme height 20 feet. Circumference 1 foot. Height from ground to the intersection of the first branch, 5 feet. Chiefly remarkable on account of its seeds, called here Indrajebbo, which are used medicinally and held in great estimation. The juice of the leaves is given to young cattle to destroy worms. The bark is also used medicinally. The tree abounds.

74 Patolee. Bignonea Suaveolens? Extreme height 20 feet. Circumference 1½ feet. Height from ground to the intersection of the first branch, 12 feet. The bark is employed medicinally. No use seems to bemade of the wood. The tree is not very common.

75 Pamphoonea. Bignonia chelonoides? Extreme height 20 feet. Circumference 1 foot. Height from ground to the intersection of the first branch, 8 feet. The bark and fruit are employed medicinally, but no use is made of the wood.

76 Nooniaree, Looniaree or Noonononea. Extreme height 36 feet. Circumference 4 feet. Height from ground to the intersection of the first branch, 7 feet. A common tree, chiefly used for firewood though ploughshares are occasionally made from this wood. The bark is employed medicinally in fever.

77 Gooroohado. Extreme height 22 feet. Circumference 2 feet. Height from ground to the intersection of the first branch, 10 feet. Chiefly used for firewood though rafters are occasionally made of this wood.

78 Hinjolo; Eugenia acutangula? Extreme height 30 feet. Circumference 4½ feet. Height from ground to the intersection of the first branch, 6 feet. Grows in abundance on the banks of rivers. The wood is not affected by damp, and is therefore generally used for the wooden frame work at the bottom of wells. Rice pounders are also made of it. The bark is given medicinally to women after childbirth.

79 Lodhoka sijhoo Euphorbia Tirucalli? Extreme height 20 feet. Circumference 2 feet. Height from ground to the intersection of the first branch, 6 feet. Not common. It is said to yield a sort of milk which is made into a cataplasm and applied to boils &c. It is also used for killing fish by the keyouts.

80 Salora. Extreme height 22 feet. Circumference 1 foot. Height from ground to the intersection of the first branch, 5 feet. A common tree only used for firewood. The leaves are eaten.

81 Khakodha. Extreme height 30 feet. Circumference 2 feet. Height from ground to the intersection of the first branch, 9 feet. A common tree only used for firewood.

82 Khookoondea. Extreme height 30 feet. Circumference 2 feet. Height from ground to the intersection of the first branch, 9 feet. A common tree only used for firewood.

83 Killakooroowan. Extreme height 20 feet. Circumference 1 foot. Height from ground to the intersection of the first branch, 6 feet. The fire sticks used by the shikarees for night hunting are taken from this tree. It also yields an oil which is applied to the sores of cattle. The tree is common.

84 Koeto Feronia elephantum. Extreme height 50 feet. Circumference 5 feet. Height from ground to the intersection of the first branch, 10 feet. Bandy wheels are sometimes made of this wood. The tree is not very common. The fruit is eaten and the gum which this tree yields is much used.

85 Mosanea. Extreme height 15 feet. Circumference 2½ feet. Height from ground to the intersection of the first branch, 4 feet. Not very common. The bark is used medicinally for wounds and sores. The wood is useless except for firewood.

86 Gongosheolee Dondeepoholo. Extreme height 25 feet. Circumference 3 feet. Height from ground to the intersection of the first branch, 7 feet. No use seems to be made of the wood. The flower which has a powerful perfume is offered in all the pagodas to the presiding divinity.

87 Pendoora. Extreme height 20 feet. Circumference 2 feet. Height from ground to the intersection of the first branch, 1 foot. The fruit is eaten and the bark used medicinally. The wood is useless except for firewood.

88 Ambhota. Extreme height 20 feet. Circumference 2 feet Height from ground to the intersection of the first branch, 7 feet. Useless except for firewood.

89 Kopassea. Extreme height 20 feet. Circumference 2 feet. Height from ground to the intersection of the first branch, 7 feet. Useless except for firewood.

90 Potoobaolo. Extreme height 45 feet. Circumference 4 feet. Height from ground to the intersection of the first branch, 12 feet. Occasionally used for bandy wheels and ploughshares. The leaves are eaten as a sort of vegetable by the Hill people. Tolerably common.

91 Joree. Extreme height 60 feet. Circumference 5 feet. Height from ground to the intersection of the first branch, 8 feet. Bandy wheels are occasionally made of this wood, which is also burnt for firewood. The seeds are eaten by the Khonds. The tree is tolerably common.

92 Chochena. Extreme height 60 feet. Circumference 5 feet. Height from ground to the intersection of the first branch, 9 feet. Chiefly used for firewood, the tree bring tolerably common. The bark is used medicinally in fever. The milk is given medicinally to children in a disease called "Doobellee."

98 Bokmo, Cæsalpinia sappan. Extreme height 36 feet. Circumference 2 feet. Height from

ground to the intersection of the first branch, 8 feet. The common powder used at the Holee festival is extracted from the wood of this tree. It is not very plentiful.

94 Ghunteoh Patoolee. Extreme height 22 feet. Circumference 1½ feet. Height from ground to the intersection of the first branch, 10 feet. Used occasionally for axletrees and rafters but chiefly for firewood, the tree being rather common.

95 Chorayegodee. Extreme height 22 feet. Circumference 1½ feet. Height from the ground to the intersection of the first branch, 6 feet. Used for firewood.

96 Amboodha spondias mangifera ? Extreme height 30 feet. Circumference 2½ feet. Height from the ground to the intersection of the first branch, 7 feet. Used for firewood. The fruit is eaten. Tree tolerably common.

97 Kontabaolo. Extreme height 30 feet. Circumference 2 feet. Height from the ground to the intersection of the first branch, 7 feet. The tree abounds and is chiefly used for firewood, though ploughshares are occasionally made of the wood. The bark is used medicinally.

98 Borodha. Extreme height 30 feet. Circumference 2 feet. Height from the ground to the intersection of the first branch, 8 feet. Tolerably common and used for firewood. The leaves are eaten as a sort of vegetable.

99 Ghoralanjea or Tentara ? Extreme height 30 feet. Circumference 3 feet. Height from the ground to the intersection of the first branch, 10 feet. Used for spinning wheels, sugar presses and ploughshares, and burnt for firewood, being tolerably common.

100 Kodumbo Nauclea oriental ? Nauclea cadamba ? Extreme height 80 feet. Circumference 6 feet. Height from the ground to the intersection of the first branch, 32 feet. This is sometimes made into boats in the manner previously described. The flower is offered at the shrines of the Hindoo gods.

101 Rooradea. Extreme height 12 feet. Circumference 1 foot. Height from the ground to the intersection of the first branch, 3 feet. The fruit is eaten; but no use is made of the tree.

102 Hadakonkalee. Extreme height 12 feet. Circumference 2 feet. Height from the ground to the intersection of the first branch, 4 feet. Useless.

103 Goonaieho Nerium odoratum ? Extreme height 25 feet. Circumference 2 feet. Height from the ground to the intersection of the first branch, 6 feet. This is the oleander tree and is tolerably common.

104 Gooroobolee. Extreme height 18 feet. Circumference 2 feet. Height from the ground to the intersection of the first branch, 4 feet. Wood useless. The fruit is employed medicinally.

105 Kodoro. Extreme height 30 feet. Circumference 2½ feet. Height from the ground to the intersection of the first branch, 12 feet. Only used for firewood.

106 Gondopolaso. Extreme height 45 feet. Circumference 2½ feet. Height from the ground to the intersection of the first branch, 8 feet. Bandy wheels and ploughshares are occasionally made of this wood, but it is chiefly burnt for firewood, being tolerably common.

107 Sohojo Maree. Extreme height 25 feet. Circumference 1½ feet. Height from the ground to the intersection of the first branch, 8 feet. Tolerably common in Bodogoda, where it is burnt for firewood but not in Goomsur. The bark is used medicinally.

108 Mohonea Vangueria spinosa ? Extreme height 25 feet. Circumference 1½ feet. Height from the ground to the intersection of the first branch, 8 feet. Used for firewood. The bark is employed medicinally in fever. Tolerably common.

109 Kolee Kouradea. Extreme height 25 feet. Circumference 1½ feet. Height from the ground to the intersection of the first branch, 8 feet. Tolerably common and burnt for firewood, the leaves are applied to wounds. The fruit is eaten.

110 Dalosingha or Taloosinghee. Extreme height 25 feet. Circumference 1½ feet. Height from the ground to the intersection of the first branch, 6 feet. Abounds, and is burnt for firewood and charcoal. Ploughshares are sometimes made of the wood.

111 Meresingha. Extreme height 30 feet. Circumference 2½ feet. Height from the ground to the intersection of the first branch, 8 feet. Tolerably common, and burnt for firewood. The leaves are used in curry stuff.

112 Konchona, Michelia champaca ? Extreme height 30 feet. Circumference 2½ feet. Height from the ground to the intersection of the first branch, 8 feet. Tolerably common. Ploughshares are occasionally made of the wood. The flowers are offered at the shrines of the Hindoo divinities. There are two varieties of the tree called respectively the "Dhobo" and Rongo.

113 Boroana Capparis trifoliata ? cratæva tapia ? Dyosperos cordifolia ? Extreme height 40 feet. Circumference 5 feet. Height from the ground to the intersection of the first branch, 9 feet. Tolerably common and burnt for firewood. The bark is used medicinally for wounds.

114 Neraso. Extreme height 25 feet. Circumference 2½ feet. Height from the ground to the intersection of the first branch, 8 feet. Tolerably common and burnt for firewood. Ploughshares are sometimes made of the wood. The bark is used medicinally for wounds.

115 Nagisilvoro Mesua ferrea ? Extreme height 30 feet. Circumference 3½ feet. Height from the ground to the intersection of the first branch, 9 feet. A medicine used for diarrhœa, rheumatism &c. is extracted from the flower. The flowers are worn by the Oriyas and the Ra-

jahs stuff their pillows with them. The tree is tolerably common, but no use seems to be made of the wood.

116 Rahana. Extreme height 30 feet. Circumference 1½ feet. Height from the ground to the intersection of the first branch, 11 feet. Tolerably common and burn for firewood ; wooden pestles and ploughshares are sometimes made of this wood.

117 Pocholoro. Extreme height 30 feet. Circumference 2½ feet. Height from the ground to the intersection of the first branch, 6 feet. Tolerably common, only used for firewood and charcoal.

118 Ponposo Komaree. Extreme height 30 feet. Circumference 2 feet. Height from the ground to the intersection of the first branch, 8 feet.

119 Kola sahajo. Extreme height 50 feet. Circumference 4 feet. Height from the ground to the intersection of the first branch, 18 feet. Abounds and is burnt for firewood and potash. The bark is used in tanning.

120 Pitolo. Extreme height 30 feet. Circumference 2 feet. Height from the ground to the intersection of the first branch, 6 feet. Abounds but is only burnt for firewood.

121 Choureeona. Extreme height 30 feet. Circumference 3 feet. Height from the ground to the intersection of the first branch, 8 feet. Tolerably common and burnt for firewood. The bark is used medicinally for rheumatism. The flowers are worn.

122 Chalodhoua Erythrina indica ? Extreme height 30 feet. Circumference 2 feet. Height from the ground to the intersection of the first branch, 6 feet. Only used for firewood. Abounds.

123 Paneeollo. Extreme height 40 feet. Circumference 2 feet. Height from the ground to the intersection of the first branch, 8 feet. Tolerably common and burnt for firewood. The bark is used medicinally.

124 Dharonjo. Extreme height 60 feet. Circumference 4 feet. Height from the ground to the intersection of the first branch, 8 feet. Tolerably common. No use seems to be made of the wood. The bark is used medicinally by women after childbirth ; the juice of the leaves is supposed to cure itch.

125 Beejee Kooroowan. Extreme height 25 feet. Circumference 2 feet. Height from the ground to the intersection of the first branch, 8 feet. Tolerably common, and burnt for firewood. The milk is used for wounds.

126 Oshoko Jonesia asoca ? Extreme height 50 feet. Circumference 3 feet. Height from the ground to the intersection of the first branch, 8 feet. Scarce in Goomsur, but abounds in Bodogoda, where it is burnt for firewood. The flowers are offered at the shrines of the Hindoo divinities. The bark is used medicinally for diarrhœa.

127 Korra Strychnos nux vomica ? Extreme height 50 feet. Circumference 5 feet. Height from the ground to the intersection of the first branch, 20 feet. Bandy wheels and ploughshares are made of this wood. The seeds are poisonous but are used medicinally. Iron tools are sharpened on blocks of this wood. The leaves are eaten by Vishnovos. The tree is tolerably common

128 Baygoona. Extreme height 21 feet. Circumference 1 foot. Height from the ground to the intersection of the first branch, 5 feet. The wood is useless except for firewood. The leaves are used medicinally for fever. The tree is tolerably common.

129 Solopo. Extreme height 40 feet. Circumference 3 feet. Height from the ground to the intersection of the first branch, 28 feet. This is a palm held in great estimation by the Khonds on account of the intoxicating liquor which they draw from it, the inside of the tree when pounded forms a sort of flour, which is eaten by the Khonds and also by Hindoos in times of scarcity. The tree is not very common. With regard to trees of this class, it seems sufficient to state that there are two kinds of date trees termed respectively the " Bodo and Sano khojeree :" the latter is very common, the former scarce.

130 Shyalee. Circumference 1½ feet. This is a large creeper which abounds in the jungles, and yields a fibre which is most extensively used. The leaves are used for eating from and for making " tullaries" small umbrellas worn on the head. The Seeds are used medicinally.

131 Polaso, Butea frondosa ? Circumference 1½ feet. A common creeper remarkable chiefly on account of the lac which it yields. The leaves are used for eating from, the flower yields a red dye which is used for the sectarian mark of the worshippers of Vishnoo, and is mixed with the Bokmo, to produce the red powder used at the Holee festival.

132 Contayecoollee. Circumference 1½ feet. This is also a large common creeper. The charcoal used in making country gun powder, is made by burning this tree. The chatty used in pacottahs is placed in a frame work made of this wood.

133 Pichoolee. Circumference 1½ feet. This is a large creeper which is very common. The bark is used medicinally for wounds and contusions.

134 Shalimbobanso. Extreme height 40 feet. Circumference 2½ feet. Two species of bamboo which abound.

135 Conta banso Bambusa spina. Extreme height 80 feet. Circumference 1½ feet. Two species of bamboo which abound.

136 Bolungee banso. Extreme height 25 feet. Circumference ½ foot. Two species of bamboo which are not common.

137 Soondorogoyan banso. Extreme height

30 feet. Circumference 3¼ feet. Two species of bamboo which are not common.

138 Bono Koniaree. Extreme height 50 feet. Circumference 3 feet. Height from ground to the intersection of the first branch, 10 feet. Used for planks, boxes and walking sticks. It is scarce.

139 Baee Dhimeree. Extreme height 30 feet. Circumference 2½ feet. Height from ground to the intersection of the first branch, 8 feet. Burnt for fire wood being tolerably common. The leaves are used for eating from; the fruit is eaten. Not very common.

140 Moddoro goodee. Extreme height 40 feet. Circumference 2½ feet. Height from the ground to the intersection of the first branch, 8 feet. Used for ploughshares and rafters and burnt for fire-wood, not very common.

141 Babolo. Extreme height 25 feet. Circumference 2 feet. Height from the ground to the intersection of the first branch, 8 feet. Used for ploughshares, sugar crushers, and for fire-wood, not very common.

142 Jundamaree. Extreme height 30 feet. Circumference 2½ feet. Height from the ground to the intersection of the first branch, 6 feet. Used for ploughshares, and burnt for fire-wood, being very common.

143 Woon. Extreme height 60 feet. Circumference 5 feet. Height from the ground to the intersection of the first branch, 5 feet. No use is made of the wood, the tree is prized on account of its fruit which is pickled, and eaten in other forms, the leaves are used for eating from; the flowers are eaten. The tree is scarce.

144 Koromonga, Aveorhoa Carambola? Extreme height 36 feet. Circumference 3½ feet. Height from the ground to the intersection of the first branch, 9 feet. No use is made of the wood, the tree is prized on account of the fruit which is pickled. The flowers are given medicinally to children. The tree is scarce.

145 Dhosora Khendhoo. Extreme height 60 feet. Circumference 5 feet. Height from the ground to the intersection of the first branch, 18 feet. Used for ploughshares and bandies. The fruit is eaten. The wood is tolerably common and is burnt for fire-wood.

146 Ambelee toba, Citrus medica? Extreme height 30 feet. Circumference 1 foot. Height from the ground to the intersection of the first branch, 6 feet. Wood useless except for fire-wood. The bark is used medicinally for colic and diseases of the stomach. The fruit is pickled. The tree is not common.

147 Modoroo toba. Extreme height 30 feet. Circumference 1 foot. Height from the ground to the intersection of the first branch, 9 feet. Wood useless except for fire-wood. The tree is common. The fruit is eaten.

148 Kheerokolee, Mimusops Kauki? Extreme height 30 feet. Circumference 3 feet. Height from the ground to the intersection of the first branch, 6 feet. A hard wood, used for ploughs and mallets. It is not common.

149 Naringhee. Extreme height 30 feet. Circumference 3 feet. Height from the ground to the intersection of the first branch, 7 feet. Used for ploughshares and bandies. It is tolerably common and burnt for firewood.

150 Kossaye. Extreme height 22 feet. Circumference 1 foot. Height from the ground to the intersection of the first branch, 7 feet. Useless except for firewood.

R. M. MACDONALD,
Assistant Agent.

RUSSELLCONDAH, Assistant Agent's Office, *4th December* 1854.

(8203) *Hindustan Timber Trees: Dr. Roxburgh's Woods of Hindustan.*

The specific gravities have been calculated from comparatively imperfect data, and therefore can only be regarded as rough approximations.

Specimens of the wood of the Indian cedar Cedrus Deodara, and of the cypress, "cupressus

torulosa," from the Himalayas, were shown by Dr Royle at the Exhibition of 1851 : the former has been introduced into England as a beautiful ornamental tree and appears to promise well as a useful timber tree, as the wood works well and freely.

(8205) *Madras Timber Trees, Timber and Fancy Woods*, being a classified list of woods, native, or grown in the Madras Presidency, from the Juries' Reports, Madras Exhibition: 1855 ; Dr. Hugh Cleghorn, Reporter.

1. Acacia arabica, Babool, *Eng.* Baboola. *Hind.* Curvala, *Tam.* Nulla toomma curra, *Tel.* This very hard tough wood is extensively used, but cannot be obtained of large size, and is generally very crooked. It is used for plough shares, naves of wheels, &c., and generally for all purposes, for which a bent hard wood is required. It makes excellent tent pegs.

The tree is found in every district, and is worthy of cultivation on account of its gum, timber, and its seeds, a favorite food of sheep, &c. It is of rapid growth, and requires no water, flourishing in dry arid plains, and especially in black cotton soil, where other trees or rarely met with. The bark is extensively used for tanning, and gives a reddish tinge to the leather.

2. Acacia catechu, Kheir, *Hind.* Wodahalay, *Tam.* The wood of this tree is less hard and durable than that of the other *Acacias*. The tree is small, and occurs more frequently in the Deccan than in the Carnatic. The watery extract (kut) is largely manufactured.

3. Acacia leucophlœa, Velvaila, *Tam.* Tella toomma, *Tel.* Kikar, *Hind.* A good dark coloured wood, but generally small. The specific name is given from the whitish colour of the bark, which is used in distilling arrack. This Acacia is easily distinguished by its panicled globular inflorescence and stipulary thorns.

4. Acacia odoratissima, Caroovangay, *Tam.* A strong and heavy wood of rapid growth, attaining considerable size, and well suited for naves and felloes of wheels. The tree is abundant, and grows in almost any soil. The grain is ornamental but rather open.

5. Acacia speciosa, Dirisana, *Tel.* Velvangay, *Tam.* A very serviceable timber, easily procured at Madras, this is the *A. serissa*, which is extensively planted along the Ganges Canal. The tree is of large size and rapid growth, the wood of light colour, durable and very hard.

6. Acacia sundra, Currangally, *Tam.* A very hard, heavy and durable wood, used for posts and rice pestles. The tree is rather large and abundant, but the wood is not generally to be obtained in the market in planks of any size. At Guntoor, Mr. Rohde states that posts 5 feet long, are procurable, at 12 Rs. per 100, these are well suited for fencing, though the non-elastic nature of the wood is unfavourable to the holding

of nails driven into it. The natives regard it as the most durable wood for posts in house building.

8. Adenanthera pavonina. Wood hard, durable, red, yielding a dye, not procurable generally in any quantity. The tree is of handsome appearance.

10. Ailanthus excelsa, Peddu mau, *Tel.* Peru marum, *Tam.* A large tree, resembling the ash in general appearance, wood light and white, used for making sword handles, &c.

11. Alangium decapetalum, Alinjee marum, *Tam* Anisarooly Mara, *Can.* Akola, *Hind.* The wood is said by Roxburgh to be " beautiful" and Wight found it to sustain a weight of 310 lbs. but he had never seen a ten *inch* plank. The jury had no means of verifying these statements, only one specimen having been forwarded to them.

15. Aquilaria Agallocha—Eagle wood or Aloes wood. Aglay marum, *Tam.* Agar, *Hind.* Contains a fragrant resinous substance. The specimen from Shemogah is green and old, (the two others are yellow, and appear to have been obtained from a different tree.) It remains to identify the tree yielding this odoriferous wood, which is sold by weight, and is reported to have been brought from the Malayan Peninsula.

16. Areca catechu—Betel nut palm, Sooparee, *Hind.* Camoogoo, *Tam.* A palm of remarkably perpendicular growth, attaining a height of 30 or 40 feet with a tuft of feathery leaves at the extreme top, the trunk is only a few inches in diameter, the structure of the wood is like that of palms in general, and might be used in turnery for small objects. The nut is used by the natives with the betel leaf. It is hard and peculiarly streaked, and is used in turnery for small ornamental work. Used in Travancore for spear handles and bows, for which it is well suited, being very elastic.

17. Artocarpus hirsuta. Angelie marum, *Tam.* A large tree used in Travancore for making canoes, &c., the trunk being hollowed out Rheede figures the tree and praises the timber. It is (the jury understand) confined to the Western Coast.

18. Artocarpus incisa—Bread fruit tree. A tree of slow growth, not uncommon in Gardens about Madras.

19. Artocarpus integrifolia—Jack tree, Pillah *Tam.* Panasa, *Tel.* Alasegana mara, *Can.* Excellent timber, at first yellow, changing to brown, much used for furniture in Ceylon, somewhat resembling Mahogany in colour and appearance, but does not bear great alternations of dryness and moisture, suitable for house carpentry in general. The tree grows rapidly, and the fruit is prized. A very brittle wood when dry.

20. Atalantia monophylla, Caatyaloo micha marum, *Tam.* A small tree, wood close grained, hard and heavy. It is pale yellow, and if procurable of sufficient size, would be very valuable for cabinet purposes.

23. Azadirachta Indica, Neem tree, Vaypum marum, *Tam.* Vepa Mannoo, *Tel.* Hard heavy wood, when old, difficult to work, but *beautifully* mottled, as in Mr. Rohde's specimen. The seed affords a valuable bitter oil. The tree is found every where, attaining a large size in some localities, deserving of attention for ornamental work.

24. Bassia longifolia—Mohwa, *Hind.* Elooppa marum, *Tam.* Hippa Mannoo, *Tel.* Good wood for trenails, it is comparatively free from the attacks of the *Teredo navalis*—it is procurable among the logs brought down the Godavery. It is valued for all purposes, in situations where it is not exposed to air, as planking of ships below the water line, frames on which well walls are built &c., (J. R.) Nearly equal to teak but smaller. Much used for construction of carts at Coimbatore, and in Malabar, where it attains a large size, it is used for spars. (R. W.) A valuable fatty oil is obtained from the seed.

25. Bauhinia Richardiana—Introduced from Madagascar, of this wood we have no knowledge. The trees in the country being still young.

26. Bauhinia tomentosa—Caat Attie, *Tam.* A tree of small size, the wood dark brown and hard—not much in use. Bark used as cordage. Several of the Bauhinias yield dark coloured heavy and durable timber. Diphylla is the *Yepi* of Nellore, Guntoor and Masulipatam.

27. Bauhinia variegata—Irkumbalitha mara, *Can.* A beautiful tree with variegated flowers, wood of little use.

28. Berrya ammonilla—Trincomallee wood, *Eng.* Tircanamalay marum, *Tam.* Introduced from Ceylon, the wood is annually imported from Trincomallee, by which appellation it is known in the market. It is highly esteemed for its lightness and strength, is straight-grained—slightly pliant, tough and little affected by the atmosphere, employed in the construction of the Massoola boats of Madras (Wight). Used for spokes of wheels, helves, handles, a pulse, frames, poles and shafts of carriages, it is inferior to *Saul* for spokes, and to the Babool for some other purposes, but it is comparatively light and easily worked (Rohde). The market is still dependent on importation from Ceylon.

29. Bignonia suberosa—A very handsome tree with fragrant flowers and spongy bark, which is a very inferior kind of cork.

31. Borassus flabelliformis—Palmyrah: Panna marum, *Tam.* Tatti chettoo, *Tel.* This tree is very abundant, especially in sandy tracts near the sea. It is used chiefly for rafters, joists and reapers, when of good age, the timber is very valuable for this purpose, the trunk is split into 4 for rafters, into 8 for reapers, these are dressed with an adze. Jaffna Palmyrahs are famous,

and were largely imported in former times. From the structure of the fibres, it splits easily in the direction of its length, but supports a greater cross strain than any other wood: iron nails, however, rust rapidly in it. The fruit and the fusiform roots of the young trees (in the Northern Circars) are used as an article of food by the poorer classes. The leaves are used for thatching and coarse fibre. Jaggery and Toddy are extracted from the tree, the former is extensively used in the manufacture of sugar in Vizianagrum and Rajahmundry. Very neat baskets of Palmyrah leaf are made at Tinnevelly.

32. Briedelia spinosa ? Moolloo vangay, *Tam.* Wood not known in Madras, the tree is not uncommon, and attains a considerable size in the alpine jungles.

33. Butea frondosa, Palas, *Sans.* Dhak, *Hind.* Porasum, *Tam.* Thorus mara, *Can.* Moduga chettoo, *Tel.* A common tree thriving well in many parts of the country ; flower deep red, used as a dye. Many esteem the wood for gunpowder charcoal. The fields of Plassey took its name from this tree.

34. Cæsalpinia coriaria, the Dibi dibi. The tree was introduced from seed supplied by Dr. Wallich, about 20 years ago, the pods are collected with care, being valuable for tanning purposes.

35. Cœslpinia sappan. The Sappan tree, Puttungay. *Hind.* Isiapangum, Vuttunghy, *Tam.* Used for dyeing ; cultivated in Paulghaut for the purpose of dyeing ; the straw used in mat making (Wight), from its high price for this purpose, not used for carpentry.

36. Calophyllum Inophyllum. Alexandrian Laurel, *Eng.* Pinnay marum, *Tam.* Wooma mara, *Can.* Ponna chettoo, *Tel.* A beautiful tree with an appropriate name, very common ; a good lamp oil obtained from the seeds, wood coarse grained, strong, durable and ornamental. The tree is worthy of attention, as it grows well in sandy tracts close to the sea, where few others thrive.

37. Careya arborea. Pailæ marum, *Tam.* Buddadanedi, *Tel.* Cumbia, *Can.* Wood useless, the bark serves as cordage, and is used as slow match for matchlocks in N. Circars.

38. Carcya sphœrica. Wood useless, the bark serves as cordage, and is used as slow match for matchlocks in N. Circars.

39. Caryota urens. Bastard Sago Palm. Ootaly pana, *Tam.* Bhynee, *Can.* A very ornamental palm, furnishes an inferior kind of sago and also toddy. Is extensively used under the name of Napiera in Ceylon for rafters, which are exceedingly hard and durable.

40. Casuarina equisitifolia. This tree was introduced about 50 years ago, and is now well established, growing freely and ripening seed in great abundance. In general appearance, it much resembles the Larch Fir,—it grows in 10 years to the height of about 30 feet. It generally grows very straight, and where the main shoot is broken or lopped off, throws out secondary shoots readily which are usually straight and erect. It thrives best in sandy tracts along the sea shore, and it would be desirable to plant it largely on the sand Hills, North and South of Madras where some numbers have already been grown. The wood is reddish in colour, in density and appearance it somewhat resembles Trincomallee. It bears a great strain, is well adapted for posts, and is said to bear submersion in water very well. The bark contains tannin, and a brown dye has lately been extracted from it by M. Jules L'Epine of Pondicherry. On the whole, this tree well deserves extensive cultivation on the sandy tracts, where it grows so readily.

41. Cathartocarpus fistula, Koannay marum, *Tam.* Rellie, *Tel.* A tree of great beauty, when in flower, but generally too small and crooked to yield valuable timber, wood close grained and used for tomtoms, &c. In the Malabar forests, it attains sufficient size for spars of native vessels. (Wight.) The Bark is one of the best for tanning.

42. Cathartocarpus Roxbürghii. A highly ornamental tree, in form much resembling the weeping ash. It is at present only to be found in gardens, but the wood is hard and handsomely marked, and may hereafter prove a valuable addition to the timbers of India.

43. Cedrela Toona, the Toon tree, Toon marum, *Tam.* Toona, *Hind.* Tundu, *Can.* A valuable tree of large size, wood reddish coloured, used all over India in cabinet making, scarcely inferior to mahogany, but lighter and not so close in the grain, often sold here under the general name of "Chittagong wood." It is the most valuable of the woods known by that commercial name. It is said to be abundant in Travancore. It is very deserving of careful enquiry, as to locality, supply &c. with a view to being brought into more extensive use in this Presidency. The specimen sent by general Cullen shows the grain and polish remarkably well: It is however of a brighter colour, and apparently a denser quality than any met with in the market, inducing a doubt as to its being of the same species. Found in the Mysore and Salem jungles in large quantities, also along the crest of the ghauts from Travancore to Goa.

44. Chickrassa tabularis, Aglay marum. Wood extensively used in cabinet making, also coming under the denomination of "Chittagong wood," being imported from that province, though it is abundant in the mountainous parts of the Peninsula. It makes beautiful and light furniture, but is apt to warp during the season of hot land winds. The wood is well known and easily procured.

45. Chloroxylon swietenia, Satin wood tree, Kodawah porsh, *Tam.* Billu kurra, *Tel.* This tree grows abundantly in the mountainous dis-

tricts of the Presidency, but seldom attains a large size, occasionally planks of 10 to 15 inches in breadth may be procured. The wood is very close grained, hard and durable, of a light orange colour, takes a fine polish, and is suited for all kinds of ornamental purposes, but is somewhat apt to split. For picture frames, it is nearly equal to American maple. The timber bears submersion well, in some instances it is beautifully feathered. There is this peculiarity, satin wood loses its beauty by age, unless protected by a coat of fine varnish.

46. Cicca disticha, Aranelly, Harfaroovri, *Hind.* A small tree bearing a round acid fruit, the country gooseberry, wood inferior.

47. Citrus aurantium, Orange tree, Kolinjee marum, *Tam.* The well known orange tree, wood hard, but not available of any size, or in any quantity.

48. Cluytia collina, Woadoogoo marum. *Tam.* Wodesha, *Tel.* A small tree, wood red colored, exceedingly hard and durable, but little is known of it.

49. Cocos nucifera, Cocoanut tree ; Tennam marum, *Tam.* Narrel, *Hind.* Tenkoi chettoo, *Tel.* Kinghena, *Canarese.* This tree thrives well on the sea coost, its uses and produce are well known, the wood is occasionally used for reapers &c.; for which purposes it is inferior to the palmyrah. In Ceylon, however, and on the Western Coast, hard and durable rafters are procurable The Cochin fibres were sent in a large box of this wood, the planks of which are prettily striped and of remarkable size.

50. Cordia latifolia. Wood very inferior, and of small size.

51 Cyathea arborea, Tree fern. The section of this tree fern displays well the structure of an Acrogenous stem, hollow in the centre, marked on the outside by the scars of the fallen leaves, and showing the elongation of the axis by junction of the petioles. Wood quite worthless as timber.

52 Dalbergia latifolia, Blackwood, Eroopoottoo, *Tam.* Bitti, *Can.* A magnificent tree, from which the well known Malabar black wood is obtained. Planks 4 feet broad are often procurable, after all the external white wood has been removed: it is heavy and close grained, admitting of fine polish, very much used for furniture. One of the most valuable woods of this presidency.

53 Dalbergia sissoides, Bittymarum, kar Itty or Blackwood. This is a smaller tree than D. latifolia, but more common in the forests, both yield a blakwood, and in Madras are indiscriminately called "Rose wood." The wood contains much oil which unfits it for receiving paint.

54. Dalbergia sissoo, Sissu, *Tel.* Introduced from Bengal at the recommendation of Dr. Wallich, grows to a large size, has been planted on the banks of the Toomboodra, and is thriving wonderfully ; it is growing extensively in the cantonment of Masulipatam, as an avenue tree, and has been planted in some places on the banks of the Kistnah Annicut. There are few trees which so much deserve attention, considering its rapid growth, its beauty and its usefulness. Wood hard, strong, tenacious, and compact, whilst its great durability combines to render it one of the most valuable Timbers known. The tree grows rapidly, is propagated and reared with facility and it early attains a good working condition of timber. It is used in Bengal for gun carriages.

55. Dillenia pentagyna. Pinnay marum, *Tam.* A stately forest tree, common on the face of the W. Ghauts. The wood is said to be exceedingly strong and durable, even when buried under ground ; this is believed to be the tree, which furnishes the *poon* spar, so valuable for shipping, though *Calophyllum Inophyllum* has hitherto been so considered.

56. Diospyros cordifolia. Vuckana marum, *Tam.* A hard heavy wood, colour dark brown ; it is difficult to work.

57 Diospyros ebenaster. Acha marum, *Tam.* Ebony of very superior quality is procurable in these districts as well as the Northern circars. Mr. Rohde has received 16 inch planks of a fine uniform black. Ebony is much affected by the weather, on which account European cabinet makers seldom use it except in veneer. The tree bearing the name "Achay" at Madras is Bauhinia tomentosa.

58 Diospyros mabola, (often called "mangosteen") under which name it is cultivated extensively in gardens at Vizagapatam.

59. Diospyros melanoxylon. Ebony, Toombie marum, *Tam.* The species of Diospyros have this peculiarity that the black heart wood is surrounded by white sapwood. There are several fine specimens of the genus, but the jury are unable to determine the species or verify the names. The subject is important and merits careful elucidation.

60 Ehretia lævis. Wood of very small size, the wood seems a good one.

61 Elate sylvestis, wild Date, Eajata, *Can.* Has the general characteristics of the family, but is inferior to the Palmyrah, Cocoanut, &c.

62. Emblica officinalis, Emblic Myrabolan, Aonla, *Hind.* Nelly marum, *Tam.* Nelly mara, *Can.* Usirika, *Tel.* A fruit tree, the wood of which would appear to be of service, for making boxes, &c.

63. Embryopteris glutinifera, Coosbartha mara, *Can.* Toomei, *Tel.* A middling sized tree, the wood is of indifferent quality. The viscid juice of the fruit is used for paying boats, and strengthening fishing nets and lines.

64. Eriodendron anfractuosum, White cotton tree, Elava marum. A soft almost worthless wood used for toys, floats &c. and such purposes.

65. Erythrina indica, Indian Coral tree, Moorkoo marum, *Tam.* Badida chettoo, *Tel.* This is the "Moochee" wood of Madras, soft and only used for toys, light boxes, trays, &c. The varnished toys from the Northern Circars are made of this wood.

66. Euphorbia tirucalli, Milk Hedge, Kulli, *Tam.* Wood light colored, the root of old shrubs is understood to be well adapted for gun stocks, but plants of sufficient age are seldom met with

67. Euphorbia Litchi. A fruit tree, introduced from China, the Litchi attains a height of 25 to 30 feet but does not ripen its fruit at Madras.

68 Eurya longifolia.

69. Feronia elephantum. Wood apple, Koit, *Hind.* Veela marum, *Tam.* Bilvurthitha mara, *Can.* Velluga Chettoo, *Tel.* A large tree, widely diffused in India, yielding a hard strong heavy wood, much used at Vizagapatam in house building. Said to be not very durable.

70. Ficus glomerata. Rulla kith mara, *Can.*

71 Ficus India. Banyan Tree, Ala marum, *Tam.* Ahlada mara, *Canarese.*

72. Ficus infectoria. Bassari mara.

73. Ficus nitida.

74. Ficus racemosa. Atti mara.

75. Ficus religiosa. The Pippul Tree, Arasa marum, *Tam.* Ranghy mara, *Can.* Ray aman, *Tel.* A very poor wood.

76. Ficus virens. Goovee mamoo, *Tel.* Masulapatam. These various species of Ficus are well known, and differ little from each other in their properties, The trees are large and of rapid growth, but the timber is of little value, being light, open and soft, The large drops of the Banyan after being well soaked in water to get rid of the viscid juice are used for tent poles and such purposes, bird lime is prepared from the fresh juice.

77. Gmelina aborea. Coommy marum, *Tam.* Goommedee chettoo, *Tel.* A large timber tree, growing in mountainous districts. The wood is light, of a pale yellow colour, easily worked, and does not shrink or warp; used for picture frames, decking small boats, for making venetian blinds, sounding boards, palankeen pannels, gram measures, &c. This tree deserves notice : it is very commonly used in the Vizagapatam district, for the foundation of wells and other purposes, which require it to be submerged in water, where it is remarkably durable.

78. Gossypium acuminatum, The Peruvian Cotton Plant, a biennial shrub, useless as timber.

79. Grewia tiliæfolia. Chadachey marum, *Tam.* A considerable tree, wood soft, not known at Madras.

80. Grewia Sp. Makes good walking stricks, The wood of Grewia salvifolia ia also good for the same purposes, and the bark of many species yields good fibres.

81. Guaiacum officinale, Lignum Vitæ. This shrub has been lately introduced, and is found to thrive remarkably well, readily flowering and fruiting. Its chief value is for medicinal purposes, but the wood, about 4 inches in diameter, is very hard and close grained, suited for turning. In time a supply may be available.

82. Guatteria longifolia. Thavatharoo, Asoka chettoo, *Tel.* A very handsome erect growing tree, but wood soft and useless.

83. Guazuma tomentosa. A tree, pretty common about Madras, evidently planted, the fruit is tubercled, about the size of a cherry, introduced by Dr. Anderson about 70 years ago.

84. Hibiscus lampas.

85. Hæmatoxylon campechianum, Logwood. This tree has been lately introduced, the largest as yet much resembles a fine hawthorn tree in habit and size. It grows readily and seeds abundantly, but it remains to be seen whether it will attain a large size in this country. It is used only as a dye, and the bark is astringent in a considerable degree. It is a promising tree and deserves attention,

86. Hura crepitans. Sand box. A middle sized tree of rapid growth, the trunk is strongly armed, the wood light and useless. The seeds are poisonous.

87. Hydnocarpus inebrians. Murravuttay, *Tam.* A large tree, little is known of the wood, the berry is used for poisoning fish.

88. Inga dulcis. Sweet Inga or Manilla Tamarind. Seema chinta, *Tel.* Coorkapooli marum, *Tam.* A most valuable hedge plant, is now used along the line of railway, the wood is hard. Isolated trees of 12 to 18 inches diameter are occasionally found, these resemble the hawthorn in general appearance. It is the *Pithecolobia mdulce*, Benih.

The pulp of the fruit is eatable, the seed was brought from Manilla to Samulcottah, hence the name "Manilla tamarind." The Spaniards introduced the tree to the E. Indies from Mexico.

89. Inga xylocarpa, Tangedu mara. Jamboo, *Hind.* This tree grows to a large size, and is much valued for house building, on account of its strength and toughness. It is remarkable for its thick woody legume, and is the *Xylia dolarbri formis* of Benih.

90 Jatropha multifida. Coral plant. A garden shrub.

91. Jonesia asoca. A highly ornamental garden tree, timber not available.

92. Kleinhovia hospita. A garden shrub.

93. Kydia calycina. A middle sized tree, pretty common [illegible] the Western Ghauts. Hort. Gard. 69.

94. Lagerstræmia microcarpa. Benteak. Ventakoo, *Can.* Cutcha cutta marum, *Tam.* A tree of large size with a long straight stem, the timber is of ordinary character, easily worked and suited for purposes where strength and beauty are not required.

95. Lawsonia inermis. Hennah. Mendee, *Hind.* A hedge plant, resembling the English privet, the wood strong and suited for tool handles, tent pegs, &c., the leaves yield the dye used by the natives.

96. Malphigia punicifolia. Barbadoes cherry. An ornamental shrub introduced from the West Indies.

97. Mangifera indica, Mango Tree, Maah marum, *Tam.* Mamadi chettoo, *Tel.* Mavena, *Can.* A tree of large growth, and generally diffused. The mature wood is dull grey, open, yet durable, if not exposed to wet, of the effect of which it is very sensitive. It is the cheapest wood procurable here, and used for packing cases, boarding, and rough work in general, Mr. Rohde says it holds a nail faster than any other wood known to him.

98 Melia azadirach. Margosa. Malay Vaimboo, *Tam.* Taruka vepa, *Tel.* A tree of moderate size and in some localities of large size. The mature wood is hard, durable and handsomely marked. A valuable oil is made from the seed.

99. Mimusops Elengi. Maghidam, *Tam.* Pogada mannoo, *Tel.* Moogali mara, *Can.* A tree of moderate size, cultivated for the oil obtained from its fragrant flowers. The wood is little known.

100 Mimusops hexandra. Pala marum, *Tam.*

101. Michelia Rheedii, Sampanghy marum, *Tam.* A large tree, the wood close grained and very handsomely marked in a mottled manner. It is, the Jury understand, being tried in Bombay for ship building purposes. A remarkably large specimen is exhibited by Captain Cunningham, its dimensions are 11½ feet in length, 4½ feet in breath. and 3 inches in thickness, and is apparently derived from a tree of very great age.

102. Morinda citrifolia, Noana marum, or Munja pavettay, *Tam.* Maddi chettoo, *Tel.* A small tree of common occurrence, the wood and root much used for dyeing red, this is deep yellow, easily worked and used for common purposes.

103. Nauclea cadamba, Cudum, *Hind.* Vella Cadamba, *Tam.* Rudrakshakamba, *Tel.* A noble tree, wood yellow, used for furniture.

104. Nauclea cordifolia, Munja Cadamba, *Tam.* Daduga, *Tel.* A large tree growing abundantly in the mountainons districts of the Peninsula —wood yellow, rather close grained. It is used for common purposes, and easily worked, bnt is best suited for work which is sheltered, bedsteads, &c., being much affected by alternation of dry and wet weather. N. parviflora (peer cadamba) is also frequent in the Western coast, and is valued for yielding flooring planks, packing boxes, &c.

105. Parkia biglobosa. A very elegant tree of large size, introduced from Africa, the legumes are filled with a farinaceous pulp, the wood is hard and promising. Surrounded by an astringent bark. A watery extract has been prepared, the value of which for tanning purposes has yet to be tested. A supply of timber is not yet procurable.

106. Odina Wodier—Ooday marum, *Tam.* Goompina, *Tel.* A large tree, native of mountainous districts, it is grown from cuttings, and planted in avenues, but it yields no shade in the hot weather, being without leaves till June. The wood is difficult to season, but when well seasoned, the central reddish portion is useful for many purposes.

107. Ægle marmelos, Bel, *Hind.* Vilva marum, *Tam.* Maredu, *Tel.* A thorny tree with ternate leaves, the astringent pulp of the fruit is a valuable remedy in diarrhœa; the wood is hard, but from the great medicinal value of the tree, the timber is not at present available.

108. Pavetta indica —Pavetty marum, *Tam.* An ornamental shrub 4 or 5 feet high with white flowers, timber very small.

109. Pimenta vulgaris. The "Allspice" tree, introduced from the West Indies. Several large trees are at Madras, but the climate of the Carnatic does not seem to suit them.

110. Pomciana regia. A large tree with showy coloured flowers. Introduced from Madagascar, and still confined to gardens. The wood seems good.

111. Pongamia glabra—Poonga marum, *Tam.* This large tree attaining a height of 40 to 50 feet is very common in S. India, flourishing equally well in the arid plains of the Carnatic, and on the Sub alpine tracts of Mysore. Oil is made from the seeds. Roxburgh says the wood is light, white and fit for a variety of purposes here it is used chiefly for fuel. The boughs and leaves are extensively used as manure.

112. Premna tomentosa—Kolcuttay teak *Tam.* A small tree. Wood hard and close grained of a brownish yellow colour, well fitted for ornamental purposes.

b 113 Prosopis spicigera—Parumbay, *Tam.* A thorny tree, not uncommon in the black cotton soils, attaining a large size in Mysore. Wood strong, straight-grained, and easily worked. The foliage of the tree and the character of the wood, closely resembles that of its congener *Acacia sundra.*

114. Psidium pyriferum. Guava tree, Coaya marum, *Tam.* Sebe mara, *Can.* The common Guava, found every where in gardens which probably found its way to India from S. America through the Portuguese. Wood small, but very hard, used by Dr. Hunter for wood engraving, and commonly for pegs, mallets, handles of tools &c.

115. Pterocarpus Indicus, *Wall.* Padouk *Burmese.* The "padouk" is a handsome tree with long waving branches and clusters of yellow flowers, which scent the air. It produces very fine timber, and may be considered one of

our most valuable forest trees. This species also yields Gum Kino.

116. Pterocarpus marsupium. Vangay marum, *Tam.* Whonay, *Can.* Yeangasa, *Tel.* A large handsome tree, widely diffused, yielding one of the most abundant and useful timber of S. India, when wet, it gives a yellow stain. Mr. Rohde states, that it is better suited for weather boards, exposed venetians, &c., than any other wood he has tried. It is heavier than teak, and more difficult to work. This tree yields the gum kino of commerce which is exported from Malabar. The timber is now being tried as sleepers on the Madras Railway.

117. Pterocarpus santalinus, Red Sanders, Rutta Sandanum, *Hind.* Savapoo Sandanum, *Tam.* This tree which grows abundantly in the Nagarry Hills, yields the "Red Sandal wood" of commerce. It is sold by weight as a dyewood, and forms a regular article of export. It takes a beautiful polish, but the high price of the wood for dyeing purposes, precludes its use as a timber.

118. Pterospermum Indicum—Kyabooca. This wood is obtained from the knotty excrescences or burrs of Pterospermum Indicum? it is sawn off in slabs—2 to 4 feet long and 2 to 8 inches thick. It resembles the hue of the yew, is very hard and full of curls—the colour being reddish brown, varying to orange. It is very ornamental, and much esteemed in China, India and England, where it is used for making small boxes, writing desks and other fancy ornamental work. The wood is brought to Singapore by Eastern traders, and is sold by weight.

119. Rottlera tinctoria—Cupela, *Hind.* Sarnakasary mara, Chendurapa chettoo, *Tel.* A large tree common in the Deccan and the Northern Circars. The red mealy power which covers the capsules is used in Mysore to dye silk. Wood soft and inferior.

120. Salmalia malabarica—Red Cotton tree, Poola marum, *Tam.* Moollelavoo, *Can.* Booraga, *Tel.* A large common tree, flowers of a beautiful red colour, thewood light, and spongy ; used by Moochees in their work, but very inferior.

121. Santalum Album—Sandal wood, Shandanum, *Tam.* Gandaga mara, *Can.* This very valuable tree, yielding the sandal wood of commerce, is found in abundance in Coorg and Mysore, sparingly in Canara. It is usually cut into billets, and disposed of by weight. The uses are well known. The scent is believed to be much modified by peculiarities of soil and elevation.

122. Sapindus emarginatus—Soap-nut tree, Poochee-cottay, *Tam.* A tree met with about villages all over the country. The fruit used as indicated by the native name and sold in all bazaars. Wood white, only used for fuel. In many situations, this tree yields a more profitable return than any other fruit tree.

123. Schmidelia serrata. A straggling shrub, with ternate leaves. Timber very small.

124. Semicarpus anacardium—Marking nut tree, Shayng cottay, *Tam.* Bhela, *Hind.* Jadi chettoo, *Tel.* This common tree is of no value as timber. A considerable quantity of the nuts are exported from the Deccan, and Mysore, as a mordant. The juice is so acrid, that wood cutters are unwilling to cut the tree.

125. Sethia Indica—Thavadarm, *Tam.* When fully grown, it is still a small tree, the fruit yields an oil, and the wood is esteemed as a substitute for Sandal wood.

126. Soymida febrifuga, Red wood, or Bastard Cedar, Shem Marum or Choar Kullie Marum, *Tam.* Soymeda, *Tel.* A large tree, tolerably abundant, timber most durable and strong, yet light and easily worked, deserving of attention.

127. Spathodea adenophylla. A small introduced tree.

128. Spathodea Sp.

129. Sterculia fœtida. Peenary marum, *Tam.* Gurrapa Badum Chettoo, *Tel.* A large tree, but chiefly found on the W. Coast and Mysore where it is applied to a number of useful purposes. This is one of the trees which are believed to furnish the smaller "Poon spars."

130 Sterculia guttata. A large tree.

131. Stereospermum suaveolens, Padrie marum, *Tam.* Ooloonanthree mara. *Can.* A middle sized tree with pinnate leaves, and panicled inflorescence, very fragrant wood (according to Wight,) strong and elastic, said to be suitable for making bows.

132 Strychnos nux vomica, Nux Vomica Tree, Yetti marum, *Tam.* Musidi, *Tel.* This well known tree is small, wood white and very hard, used for plough shares. The poisonous fruits are the favorite food of the Buceros Malabaricus, Hornbill.

133. Strychnos potatorum, Clearing Nut tree Taita marum, *Tam.* Judapa chettoo, *Tel.* A larger tree than the above, the fruit is well known as possessing the property of clearing water ; wood hard and serviceable, though of small size.

134. Syzygium jambolanum, Jamoon, *Hind.* Nawel marum, *Tam.* Nœrala mara, *Can.* Neradi, *Tel.* A fine large tree of common occurrence, suited for avenues ; the fruit small, and somewhat astringent, sold in the bazaars. The wood is much used for ordinary purposes, but is of little value.

135. Tamarindus indica, Tamarind Tree, Poolia marum, *Tam.* Chinta chetoo, *Tel.* Oonara mara, *Can.* A large and very handsome tree, of slow growth ; the wood hard, durable and fine veined, but apt to be faulty in the centre. The ornamental character of the wood is well shown in the handsome specimen contributed by Mr. Rohde. It is used in the manufacture of oil for its fruit and shade.

136. Tecoma stans. An ornamental garden shrub.

137. Tectona grandis, Teak, *Eng.* Teak marum, *Tam.* Tek chettoo, *Tel.* A native of the mountainous parts of Malabar, and the country bordering the Godavery, the Moulmein and Rangoon forests. This well known and far-famed tree grows straight and lofty, with cross armed panicles of showy white flowers. It seems to require 80 years to attain perfection. The wood is very hard, but easily worked; it is soon seasoned, and being oily, does not injure iron; and shrinks little. It is probably the most durable timber known, hence its value in Ship-building. The Malabar teak is considered the *best*, and is always most valued in our Government dock yards. A valuable report by Dr. Falconer on the Teak forests of the Tenasserim Coast, was published lately among the selection of Records of the Indian Government. The price of Teak wood in 1855, is 3 Rs. per cubic foot, double the ordinary rate. It is matter of regret considering the vast importance of teak timber to England, as a maritime nation, that the preservation of the teak forests was so long disregarded.

138. Terminalia alata, Marudum marum, *Tam.* Kooramarthi mara, *Can.* A very large tree, used on the Western Coast for house building and making canoes.

139. Terminalia belerica, Tanikoi or tandee marum, Cattoo eloopæ, *Tam.* Tadi chetoo, *Tel.* A very large tree with a straight trunk and spreading head; wood white and soft, but not much used. The flowers have an offensive smell. The kernel of the fruit is eaten by the natives.

140. Terminalia Berryi, Vella murda, *Tam.* This tree also attains a large size, especially at the foot of the W. Ghauts, where it is used for canoes, &c.

141. Terminalia catappa, Natvadom cottay, *Tam.* Badum, *Tel.* A beautiful large tree, found in gardens, &c., the kernels are eaten and are palatable, the wood is also useful.

142. Terminalia Chebula, Pilla murda or Kadookoy, *Tam.* Alali mara, *Can.* Heerda, *Duk.* Karaka chettoo, *Tel.* A very large tree, fruit used by harness makers. The leaves are punctured by an insect, and hollow galls are developed, which are powerfully astringent, and answer well for making ink. They also yield chintz painters and carpet weavers, their best and most durable yellow. (Roxb.)

143. Terminalia glabra, Curry murda, *Tam.* A large tree, wood dark coloured, very hard, heavy and strong, Dr. Wight speaks highly of this wood, and states that large beams are readily procurable at Coimbatore for house building purposes. It is very hard, heavy and durable under water.

144. Thespesia populnea, Poorsungkai, *Tam.* Gungarani, *Tel.* A tree much used for avenues, of quick growth, and yielding good shade. Th generally grows from cuttings, and althoug such timber is strong, hard and durable, but rar ly to be met with good, owing to the trees ro ting at the heart. It is procurable, fit for chair &c. The tree abounds in old gardens, and abo all European Stations, thriving best near th sea.

145. Thevetia nerüfolia, A garden shrub cal ed the "Exile." The wood is worthless.

146. Vachellia farnesiana, Jali mara, *Can.* Ved vully, *Tam.* An armed shrub, very common i Mysore and Deccan, exuding much gum like th babool, which it greatly resembles in its timbe the size is very small.

147. Vatica robusta, Saul, *Hind.* Googilan *Tel.* A wood in great repute, belonging to th *Dipterocarpeæ*; it is most valuable for house an ship building, Vats for liquids, door frames, an the rails and battens of doors; it is not suite for planks, it twists, shrinks, and warps, whe ever the surface is removed, even after man years' seasoning. This wood is in general us for building purposes in the Ganjam and Vizaga patam Districts. "From Colonel Baker's excel lent experiments, it appears that, compared wit Teak, its strength is about 1121 to 869. Fro Major H. Campbell's valuable experiments, un seasoned Saul broke with a weight of 1,308lbs. seasoned Saul with 1,319lbs., and teak woo with 1,091lbs. It is unquestionably the mos useful known Indian timber for engineering pur poses," (Jury Reports, Great Exhibition.)

148. Visenia umbellata. A considerable tre of great beauty, with rose coloured flowers an velvetty leaves; introduced from Sumatra, th seeds having been sent to the Horticultural So ciety's Garden, by Dr. Wallich.

149. Vitex alata. A small tree found in th Naggery Hills, leaves ternate, petioles winged.

150. Vitex altissima. A large tree of grea beauty, when in flower, frequent on the slope of the Western Ghauts, reported to be fit fo cabinet purposes.

151. Wrightia antidysenterica. Veppaula *Tam.* Pala chet oo, *Tel.* A small tree of com mon occurrence in Mysore and the Hilly parts its medicinal virtues are worthy of attention, bu the wood is of little value. The bark was former ly in request under the name of *Conessi* and i still esteemed a valuable drug by the natives. It appears to have lost its value in commerce, from not being distinguished from the bark of Wrightia tinctoria which grows in same places.

152. Wrightia mollissima. Introduced from the Naggery Hills; the yellow juice might be turned to account, butthe timber is of no value.

153. Wrightia tinctoria, Palay marum *Tam.* A small tree, the leaves of which yield an inferior kind of Indigo. Wood white and close grained, said to be suited for Turnery.

154. Zizyphus jujuba. Yellandav marum,

Tam. Elanjee mara, *Can.* Gooly mara, *Can.* Ber, *Hind.* Rega, *Tel.* The wild *Ber* tree, common almost every where; wood hard and useful, but of small size. It is used for making sandals.

(8206) *Woods of Malabar Forests* (*J. E. Chapman.*)

These woods were collected, in 1846, by Dr. Gibson, Conservator of Forests in the Bombay Presidency, for Mr. Chapman, in connection with the projected "Great Indian Peninsular Railway."

1 Jamboo; a very heavy wood.
2 Kad kud.
3 Kelaho.
4 Koompoly.
5 Kendel; a heavy, strong, dark wood.
6 Kungance.
7 Kursing.
8 Kumdee.
9 Marlee; a very heavy, brown wood.
10 Ombah.
11 Pood goossa.
12 Ruccuh korurah; a very straight-grained wood.
13 Satannah; a light, soft, close wood.
14 Sarrah.
15 Seerass.
16 Sood beebo.
17 Sawree; a white, soft wood, very light.
18 Teh pully.
19 "Jamboo," or Jambu, Mimosa xylocarpa. This tree grows to a large size: on account of its strength and toughness, it is much valued for house building.
20 "Mairtee," Pentaptera coriacea, a very common tree both above and below the Ghauts The wood is very durable, and is therefore used in house, ship, and boat-building.

(8207) *Martaban Timber trees, being Woods of Martaban* (*Dr. Wallich*).

1 Calophyllum. Thurappe. A large tree; used for masts and spars.
2 Careya. Zaza. Used for posts, &c.
3 Cynometra. Maingga. A small tree.
4 Diospyros (?). Ryamucha. Used in house building
5 Elæococarpus. Very large timber: used for masts and house posts.
6 Fagraea fragrans. Annah-beng. Compact, hard, yellow, and very beautiful wood; little used.
7 Gordonia (?) Zaza. Large common timber.
8 Hopea odorata. Tengaun. An immense tree.
9 Meenaban. A durable pliant wood.
10 Pongamia atropurpurea. Lagun. A noble tree used in boat and house building.
11 Quercus Amherstiana. Tirbbae. A large tree; used in boat building.
12 Tectona grandis. Teak wood.
13 Terminalia bialata.
14 Xanthophyllum. Saphew. A very large tree; used for posts and rafters.
15 *Pterospermum Indicum.* Lingoa wood, or the Amboyna wood of commerce, is from Ceram in the Moluccas. It was imported in considerable quantities into Great Britain during the period in which the Moluccas were British possessions. This wood, which is very durable and capable of a high polish, is abundant at Ceram, New Guinea, and throughout the Molucca seas. It can be obtained in any quantity, if the precaution is taken of ordering it during the previous trading season. The Kayu Buka of commerce is the gnarled excrescence of this tree.
16 Lingoa wood, from Ceram. A circular slab 6 feet 7 inches in diameter. These large circular slabs are obtained by taking advantage of the spurs which project from the base of the trunk, as the tree itself has not sufficient diameter to furnish such wide slabs. They are occasionally met with as large as 9 feet, but the usual size is from 4 to 6 feet.
17 Kayu Buka, from the Moluccas. This wood is obtained from the knotty excrescences which are found on the stems of the Lingoa tree It is brought to Singapore by the Eastern traders from Ceram, Arru and New Guinea, and is sold by weight. It is much esteemed as a fancy wood.

(8208) *Moulmein Timber and Fancy-woods.*

Of the eleven Timbers forwarded to the Exhibition of 1851, from Moulmein, by J. R. Colvin, Esquire, Commissioner of the Province in 1847, under their native names, several have been identified by Dr. Falconer during his visit to the Teak forest of the Tenasserim Provinces in 1848-49:—

1 Lagerstrœmia macrocarpa, pyen-ma, *Burm.* commonly known under the name of jarrool.
2 Carcya sphoerica, Bambooce, *Burm.*
3 Cyrtophyllum fragrans, Anan, *Burm.* One of the Nux Vomica tribe; One of the hardest, most compact, and heaviest woods known.
4 Pyen-ma and kazaret, *Burm.* Undetermined.
5 Pterocarpus indica, Podauck, *Burm.* One of the Leguminosæ, called Rosewood; it is a very beautiful and hard compact timber, closely resembling the Andaman wood.
6 Indike, *Burm.* Ebony.
7 Anan, *Burm.* See above.
8 Hopea odorata, Thengan, *Burm.* Of the Dipterocarpeæ or saul tribe; a very strong but coarse-grained timber.
9 Inga xylocarpa, Pyangadean, *Burm.* belonging to the Acacia tribe commonly called the

iron wood of the Arracan provinces, very hard, dense and durable.

10 Rosewood of the Tanasserim provinces, a very beautiful, hard, compact timber, resembling "Andaman wood," which is occasionally seen in the bazar of Calcutta. Mr. Mason says that the yellow wood of the jack affords beautiful timber for furniture, and in some parts of India it is highly valued. The heart of old tamarind trees furnishes a hard dark-coloured wood, resembling ebony. Roxburgh says the wood is "durable and beautifully veined." *Cassia florida* has wood "not inferior to ebony." *Pongamia glabra*, and *Wrightia coccinea* have light fine wood. The Ceylonese iron wood tree, *Adenanthera pavonina*, *Vachellia Farnesiana*, *Acacia Catechu*, and the jujube tree furnish hard, tough wood. *Cassia fistula*, *Cassia nodosa*, the chestnut tree, *Sandoricum indicum*, *Nauclea Cabamba*, and one or two species of eugenia afford good timber. These are among more than a hundred trees in the Tenasserim Provinces that furnish valuable woods, of which the selection of fifty or sixty would embrace the most useful.—*Mason*.

(8209) *Woods of Paulghaut Jungle.* (*Col. Frith.*)

1 Ab Eney, brown colour. A large tree; used for furniture.

2 Bumboo, yellow colour. A large tree; used for building and for furniture.

3 Benteak, light colour, specific gravity 0.591. Inferior; used for building and common carts.

4 Cedar, reddish colour, specific gravity 0.507. A large tree, wood aromatic; used for furniture.

5 Cedar-root. Very aromatic; used for ornamental furniture.

6 Cautovanga, dark colour. Very strong: used for wheelwright's work.

7 Chadachey, light brown colour. A small tree; used for buildings and carts.

8 Eroopoottooirvolly, brown colour, specific gravity 0.861. Used for buildings and bullock-yokes.

9 Ittee veittee, black colour. A small tree; used for furniture.

10 Kullen teak, dark colour. The best teak; very strong and large.

11 Kur[illegible]agom, light brown, specific gravity, 0·704[illegible] small tree; used for naves of wheels.

12 Kurroomardoo, dark colour. Strong wood; used for wheel wright's work.

13 Kuroongaulee. dark colour. A heavy and hard wood used for furniture.

14 Muroodoo, light colour. A small tree[illegible] used for buildings.

15 Nova, white colour. Used for shafts[illegible] cart-poles, &c.

16 Oome teak, dark brown colour. Third-rate teak.

17 Oodoogoo, red colour. A large tree; used for ploughs and building.

18 Portia, brown colour. A small tree; used for musket-stocks.

19 Teak, light colour, specific gravity 0 852. Second-rate teak.

20 Vangay, light brown colour, specific gravity 0·788. A small tree; used for beams and carts.

(8210) *Pegu Timber Trees, Timber and Fancy-woods.*

Of the Forests generally.

White Woods.—Eighty-five species are soft and useless, being only fit for fuel. Many of them however are valuable, either for their fruit, gums, oil-seed or spices; others, for their close and compact structure, are employed in the manufacture of small ware, as a species of *Nauclea* used for making combs and two species of *Erythrina* yield the light charcoal employed in the manufacture of gunpowder.

These light woods, useless as timber, belong to the families of *Urticaceæ* (including more than twenty species of *Ficus*,) and *Sterculiaceæ*, *Laurineæ*, *Rubiaceæ*, *Myristicaceæ*, *Anonaceæ*, *Spondiaceæ* and *Bignoniaceæ*, with odd species from other families.

The remaining white woods, twenty-five in number, valuable for their strength and closeness of grain, demand a more extended notice. Seventeen of these are fit for house-building, and eight, from the hardness and fineness of their grain, render them valuable as fancy woods for cabinet making.

Red-colored Woods.—These are twenty-five in number, seven of which, from their strength and solidity, are adapted for the various purposes of house-building; seven, from the elegance of their grain and colour, are suited to the various purposes for which mahogany is used, and eleven are suited to the finer purposes of fancy cabinet work.

Yellow Woods.—These are three in number, hard and fine grained, and suited to fancy purposes.

Dark-brown Woods.—These are twelve in number and are all valuable. Eleven are adapted for house-building, and probably for ship-building, and one for special purposes requiring great strength and hardness.

Black Woods.—These consist of four different kinds, all of which are valuable for their strength and hardness.

Light-brown Woods.—There are seven varieties of this colored wood embracing all the timber of most value in the Province, exclusive of Teak.—*McClelland*.

PEGU WOODS.

List of 25 White-Colored Woods.

Nos. 1 to 17 are adapted to every purpose of house-building.

Nos. 18 to 25 are adapted for fancy work and cabinet making.

1. *Hibiscus macrophylla* is very plentiful in Forests of the Pegu and Tounghoo districts. It is a tall slender timber, of three or four feet girth, and would do for boards and house posts. Wood white colour and adapted for every purpose of house-building.

2. *Kydia calycina*. Bokemaiza. *Burm.* Is plentiful throughout the Forests, more especially in the Pegu and Tounghoo districts. The small saplings are used, from their great strength and elasticity, by the natives, for making banghy sticks, but it is large enough to afford timber of three or four feet girth. Wood white color and adapted for every purpose of house-building.

3. *Eriolæna tilifolia*. Let-pan. *Burm.* Grows plentifully throughout the Pegu and Tounghoo districts, attaining a height of fifty feet, with a girth of seven or eight feet sometimes, but usually about six feet. It is a strong tough timber, similar in its properties to Kydia. Wood white colour and adapted for every purpose of house-building.

4. *Connarus speciosa*. Gwai-douk, *Burm.* Plentiful in all the Forests growing scattered with Teak in the Tounghoo district and in the Forests of Pegu. It is a large, heavy and strong timber. Wood white colour and adapted for every purpose of house-building.

5. *Grewia floribunda*. Myat-yah, *Burm.* A very common tree from Rangoon to Tounghoo. It is a good serviceable timber for all ordinary purposes of house-building. There are three other species of *Grewia*—*G. asiatica* is a large tree like *G. floribunda*, but not so plentiful. The other two kinds are small and comparatively scarce. Wood white colour and adapted for every purpose of house-building.

6. *Grewia Specta ilis* and *G. Hookerii*. Phet woon, *Burm.* Both very plentiful, and of a quality like the last mentioned. They attain a girth of about three to four feet and grow up tall and remarkably straight. They are found with Teak in the Forests of Pegu and Tounghoo. Wood white colour and adapted for every purpose of house-building.

7. *Sapindus rubiginosa*. Hseik-kyee, *Burm.* This tree is not very plentiful. It is found in the Pegu district, where it attains a girth of three or four feet, growing tall in proportion and straight. Wood white colour and adapted for every purpose of house building.

8 *Millingtonia Simplicifolia* is also scarce, but found in the Forests of the Pegu Valley. Its properties as a timber are valuable from its weight and strength. Wood white colour and adapted for every purpose of house-building.

9. *Sandoricum Indicum*. Theit-to. *Burm.* This timber is large and plentiful, both in the Rangoon and Tounghoo districts. It is one of those trees which are cultivated by the Burmese for their fruit. It is found near all large villages, but it is scarce in the forests. Wood white colour and adapted for every purpose of house-building.

10. *Amoora* (*Aglaia*) *rohituca*. Chayaukayoe. *Burm.* This tree is scarce, but found in the Tounghoo Forests. Wood white colour and adapted for every purpose of house-building.

11. *Juglans tricoca*. Ta-soung-let-wah, *Burm.* Scarce, but found on the banks of the streams in the Pegu district. It is a hard strong timber. Wood white colour and adapted for every purpose of house-building.

12. *Geloxium bifarium*. Hsai than bayah, *Burm.* Is found in the Rangoon district, it seldom exceeds three feet in girth, and is only fit for house posts. Wood white colour and adapted for every purpose of house-building.

13. *Excecaria agallocha*. Bone-bayaza, *Burm.* Plentiful in the Rangoon and Tounghoo districts. Wood white colour and adapted for every purpose of house-building.

14. *Walsura piscidia*. Joe-boe, *Burm.* This tree is very plentiful in the Pegu and Tounghoo Forests, as well as in the Tharawaddy Forests. The timber is large, heavy and strong. Wood white colour and adapted for every purpose of house-building.

15. *Canarium geniculatum*. This is a large and valuable timber found in the Pegu Valley but it is scarce. Wood white colour and adapted for every purpose of house-building.

16. *Indigofera sp.* Doun-daloun, *Burm.* This tree is four or five feet in girth, found both in the Rangoon and Tounghoo districts though it is scarce. Wood white colour and adapted for every purpose of house-building.

17. *Terminalia belerica*. Pangah, *Burm.* and *T. violata*. Laibwai, *Burm.* The latter very plentiful throughout the Pegu, Tounghoo, and Tharawaddy Forests; the former less plentiful. Both are large timber and would answer for all purposes of house-building. Wood white colour and adapted for every purpose of house-building.

Woods from Nos. 18 to 25 are adapted to fancy work and Cabinet making.

18. *Semecarpus anacardium* [redacted]in, *Burm.* Is a middle-sized tree, common [redacted] Pegu and Tounghoo Forests. Adapted for fancy work and cabinet making.

19. *Sibia sp.* (*glomerata*) Thit-phyew, *Burm.* Very plentiful in Prome, Pegu and Tounghoo, as well as about Donabew; a compact and close-grained wood, seven or eight feet in girth, and is a timber that deserves to be attended to with a view of bringing it into use. Adapted for fancy work and cabinet making.

20. *Casuaria pentandra*. Thabyaiywet-kya,

Burm. Scarce, but found in the Pegu district. Timber strong and close-grained. Adapted for fancy work and cabinet making.

21. *Chaulmoogra odorata.* Taliennoe, *Burm.* There are a few trees of this about Rangoon, and it is also met with on the banks of streams in the Tounghoo Forests, but must be considered scarce. Adapted for fancy work and cabinet making.

22. *Strychnos nux-vomica.* Kha-boung, *Burm.* This is a very common tree throughout the Forests. The timber is strong and close-grained, but never of very large size. Adapted for fancy work and cabinet making.

23. *Conocarpus robustus.* Baib-ya, *Burm.* Very large and strong timber, growing plentifully in the Pegu, Tounghoo and Prome Forests along with Teak. Adapted for fancy work and cabinet making.

24. *Bauhinia parviflora.* also *B. brachycarpa.* Bwai-jin. *Burm.* The former attains three or four feet in girth, the latter is of rather smaller size. The first is very plentiful throughout the Tounghoo and Prome Forests. Adapted for fancy work and cabinet making.

25. *Elæodendron integrifolia.* Jouk-bin, *Burm.* This is a very plentiful, strong, fine timber, and is found throughout the Forests of the Tounghoo and Pegu districts, as well as about Rangoon. Adapted for fancy work and cabinet making.

List of 7 Red-colored Woods.

The following seven sorts, Nos. 26 to 32, are strong and adapted for house-building:—

26. *Heritiera minor* and *H. litoralis.* Kanazœ, *Burm.* These species are common in the Rangoon district, along the creeks and Sunderbunds. They are the Soondree wood so well known in Bengal for its strength and durable qualities. Wood red colour strong and adapted for house building.

27. *a. Eugenia pulchella.* Khway-tha-byai. Very plentiful in the Pegu and Tounghoo districts.

b. E. myrtifolia, Thabaijeen, *Burm.*

c. E. vulgaris. Thabyai-tha phan, *Burm.*

d. E. Ternifolia Thabyew-tha-byai, and *E. jambolana* also occur, but less plentifully than the first-mentioned species. They all afford excellent close-grained strong timber, but subject to the attack of white ants. Wood red colour strong and adapted for house-building.

28. *Sonneratia apetala.* Kambala, *Burm.* A strong hard wood of coarse grain, found throughout the Sunderbunds, under the parallel of Rangoon. It is the timber of which boxes for packing beer and wine are made in Calcutta. Wood red colour strong and adapted for house-building.

29. *Terminalia chebula.* Kayoobin, *Burm.* A large timber, plentiful throughout the Teak Forests. Wood red colour strong and adapted for house-building.

30. *Lagerstræmia Pyminah.* Pymmah. *Burm.* A common and valuable timber, found generally all over the country. It ceases however a little below Tounghoo and Prome, so that at those places it cannot be made available for building purposes; but at all the lower stations from Prome and Tounghoo downwards, it ought to supersede the use of Teak. Wood red colour, strong and adapted for house-building.

31. *Aglaia Spectabilis.* A large tree, met with along the banks of rivers in the Pegu and Tounghoo districts. It affords a light serviceable timber, somewhat stronger than the American Pine, and capable of being wrought with little labour. Wood red colour strong and adapted for house-building.

32. *Ulmus alternifolius* and *U. integrifolius.* Thalai, *Burm.* Two of the largest trees in the province; they are found about towns and villages in the Prome district, but not below that latitude. The elms to which family the trees in question belong afford valuable timber. Wood red colour strong and adapted for house building.

The following seven kinds of red wood, Nos. 33 to 39, are equivalent to mahogany:—

33. *Cedrela Toona,* Thit-kodo, *Burm.* Found on the banks of streams in the Tounghoo district, but it is scarce. Wood red; equivalent to mahogany.

34. *Swietenia chikrassa.* Nga-bai, *Burm.* Found along with Teak in the Pegu district, but it is not very plentiful. Wood red; equivalent to mahogany.

35. *Armosia dasycarpa.* Thitwajee, *Burm.* This is found here and there widely scattered in the Swar and other Forests North of Tounghoo. Wood red; equivalent to mahogany.

36. *Pterocarpus dalbergioides. Padouk.* This is found chiefly as a large tree about the neighbourhood of Prome and habited places to the north of that town, but rarely in the Forests. Wood red; equivalent to mahogany.

37. *Careya arborea.* Baubwai, *Burm.* This is one of the most numerous trees throughout the province. The timber is large, and together with the following, forms the chief material of which the carts of the country are made. Wood red; equivalent to mahogany.

38. *Barringtonia acutangula.* Kyai-tha, *Burm.* and *B. speciosa.* Kyai-gyee, *Burm.* The former most plentiful in the Tharawaddy district and the latter in the Pegu Forests. The wood is hard and of fine grain. It is used in constructing carts. Wood red; equivalent to mahogany.

39. *Castanea indica,* Theet-khya, *Burm.* Is a large tree, plentiful in the Rangoon, Pegu and Tounghoo districts. Wood red; equivalent to mahogany.

The following eleven kinds of Red Wood, Nos. 40 to 50, are adapted to cabinet making :—

40. *Adenanthera pavonina.* Ywaigyee, *Burm.* Found in the Rangoon, Pegu and Tounghoo districts, but widely dispersed and not very plentiful. Red wood and adapted to cabinet making.

41. *Calophyllum longifolium.* Thar-rabee, *Burm.* This is found near towns, together with two other species of the same genus, which are of smaller growth. Red wood and adapted to cabinet making.

42. *Dolichampia pomifera.* Doukyamah, *Burm.* This has been found on the Pymmah Choung in the Pegu Valley. The trees are from three to four feet in girth. Red wood and adapted to cabinet making.

43. *Pygium acuminata.* Scarce, but found on the banks of streams in the Tounghoo district attaining a girth of five or six feet. Red wood and adapted to cabinet making.

44. *Photinia serratifolia.* Doukyat, *Burm.* Found in the neighbourhood of Rangoon and along the banks of the stream in the Rangoon district, in the direction of the Teak Forests. Red wood and adapted to cabinet making.

45. *Acacia stipulata.* Seet, *Burm.* A large heavy timber, found throughout the Forests from Rangoon to Tounghoo. Red wood and adapted to cabinet making.

46. *Acacia catechu.* Shabin, *Burm.* Large and plentiful timber, found in great quantities in Forests of the Prome and Tharawaddy districts, as well as on the Shan side above Tounghoo district. Red wood and adapted to cabinet making.

47. *Acacia serissa.* Seet, Burm. Found throughout the province; timber large and plentiful, particularly in the Tounghoo district. Red wood and adapted to cabinet making.

48. *Acacia elata.* Seet, *Burm.* Plentiful in the Pegu, Tounghoo and Prome districts; timber straight, lengthy and of large girth. Red wood and adapted to cabinet making.

49. *Ricinus diococa.* Tawthedinbin, *Burm.* Scarce and found only on the banks of streams in the Pegu and Tounghoo districts. Very tall large timber. Red wood and adapted to cabinet making.

50. *Antidesma paniculata.* Byitzin, *Burm* Small crooked timber, of close grain, found in the Rangoon, Pegu, Tounghoo and Tharawaddy Forests. Red wood and adapted to cabinet, making.

Yellow Woods.

There are three kinds fit for fancy work, viz.

51. *Gmelina arborea.* Kyoonboe, *Burm.* Plentiful in the Pegu and Tounghoo Forests. It is a large and remarkably strong tough timber. Wood yellow, fit for fancy wood.

52. *Morinda bracteata.* Yaiyoe, *Burm.* and *M. excerta,* Mhan bin, *Burm.* Both are small trees, only found about Phoungyee houses, in a cultivated state. Wood yellow, fit for fancy wood.

53. *Garcinia Cowa.* Toun-tha-tai, *Burm.* Scarce, but found widely dispersed in the Forests. Wood yellow, fit for fancy wood.

Dark-brown Woods.

54. *Pterospermum aceroides,* Thamajamwaizoke : also *P. subacerifolium,* and *P. acerifolium.* Najee *Burm.* Three, species of large timber, found growing along with Teak in all the Forests. The two first are plentiful but the third kind is scarce. This timber is extremely valuable and is as strong as either Teak or Oak. Its durability for purposes of ship-building has never been tested, because it has never been desicated or killed like the Teak. It attains a girth of ten or twelve feet and rises to a lofty height. Wood dark brown.

55. *Pentaptera arjuan* and *P. glabra.* Toukkyan, *Burm.* This is also a valuable timber found growing in all the Teak Forests; it consists of two kinds, both of equal value. The timber is as strong as Teak and usually attains a girth of from seven to nine feet, with height in still more lofty proportion. This timber has never, I believe, been fairly tried for ship-building. Wood dark brown.

56. *Melanorrhœa usitata.* Theet see, *Burm,.* This is the *Theet-see* or *Lignum vitæ.* of Pegu. It is plentiful in the Tounghoo and Prome Forests, especially in the former. It is of dark red colour, of extreme closeness of grain and density of structure, with a specific gravity so great, that it serves in place of iron as anchors for native boats. Its great hardness and weight prevent its being employed in house-building. It would answer for sheaths or block-pulleys and other purposes connected with machinery, where great strength and density are required. The tree is very common above the parallel of Tounghoo and grows to a girth of six feet. Wood dark brown.

57. *Dolichampia pomifera* Doukya-mah, *Burm.* Scarce, only met with on the banks of streams in the Pegu Valley, particularly in the Pymmah Choung. Wood dark brown.

58. *Butea frondosa.* Pouk-pin, *Burm.* Plentiful, but the timber is crooked and only fit for ornamental work. Wood dark brown.

59. *Mangifera attenuata.* Tawsa-thayet, *Burm.* Scarce, but found in the Pegu and Tounghoo Forests. Wood dark brown.

60. *Anacardia occidentalis.* Scarce and only found near large towns Wood dark brown.

61. *Zizyphus jujuba.* Hyee-bin, *Burm.* Scarce, only found near large towns, rarely in the Pegu and Tounghoo forests. Wood dark brown.

62. *Averrhoa carambola,* Zoungya. *Burm,* Scarce, and only fond near towns. Wood dark brown.

63. *Pierardia sapota.* Kanayoe, *Burm.* Plentiful in the Pegu and Tounghoo forests, as well as about Rangoon. Wood dark brown.

64. *Anocatrolobus carnea.* Zoungali, *Burm*, and *A mollis.* Yin-bya, *Burm.* Plentiful in the Pegu and Tounghoo Forests. The timber grows very tall, but seldom exceeds three feet in girth. Wood dark brown.

65. *Rondeletia tinctoria,* Tamayoke, *Burm.* Small timber, which, together with the last seven kinds, are adapted, from the fineness of their grain and elegance of colour, for ornamental work. Wood dark brown.

Black Woods.

66. *Dalbergia.* Yindike, *Burm.* Of this there are four kinds, all yielding a heavy timber, which will not float, similar to Sissoo. These trees are very plentiful in the Tharawaddy and Hlaine districts, also in the lower parts of the Tounghoo district. The timber seldom attains a very large size and is generally found of a girth of three or four feet. Black wood.

67. *Cassia Sumatrana.* Mayalee, *Burm.* plentiful throughout the Hlaine, Pegu and Tounghoo Forests. It is the Bombay blackwood Black. wood.

68. *Inga xylocarpa.* Pyin Kadoe, *Burm.* and *I. bijemina.* Tauyeu, *Burm.* Two species, affording ironwood. The first is called Pin-Ka-doe by the Burmese. It is found in all the Teak Forests. In the Prome Forests it is usually about six feet in girth, but in all the other forests it attains a larger size, frequently eight or nine feet. It is most plentiful throughout the province. The second species is of smaller girth, but grows to a great height. Black wood.

69. *Diospyros melanoxylon.* Ebony or Oukchinya, *Burm.* This tree is found throughout the forests, seldom however of greater girth than three or four feet. It is very plentiful. Black wood.

Light brown Woods.

70. *Dipterocarpus alatus.* Aing, *Burm* This timber is called in Bengal Battee Sal. It is excellent for every purpose of house-building, especially for posts. It is found chiefly to grow on laterite in the Tounghoo and Prome districts. Light brown wood.

71. *Dipterocarpus turbinatus.* Kauyeen, *Burm.* Timber of great size and strength. It is fit for any purpose for which Saul is employed, being of the same family. It is chiefly employed far canoe and boat building. It is found in all the Forest districts, except Prome where it is scarce. Light brown wood.

72. *Shorea robusta* or Saul. Eing-gyeen, *Burm.* This timber is found chiefly on the Shan side of the Tounghoo district, and in the Forests north of Tounghoo. Light brown wood.

73. *Melicocca trijuga.* Jobin *Burm.*, A most valuable timber, called by the Burmese Kobin, and employed by the natives of the country for cart-wheels, oil-mills, and other purposes requiring great strength and solidity. It is found in greatest perfection on the banks of the Sitang in the Kareen Forests above Tounghoo; but it is also found throughout the Pegu and Tounghoo Forests in abundance, more particularly the latter. It is also found along with Teak in Tharawaddy and Prome Forests. Light brown wood.

74. *Dillenia augusta,* Zinbyewn, *Burm.* also *D. scabra.* Byew, *Burm.* and *D. speciosa.* Thabyew, *Burm.* The two first are plentiful in the Forests of the Pegu district, but become scarce to the north of it, and the third species is scarce even there. They all three afford large and good timber for house building. Light brown wood.

75. *Hopea odorata.* Thingan, *Burm.* This timber, which is said to be plentiful in the Tenasserim Forests, is scarce in Pegu, and a few trees are to be found about the vicinity of Rangoon. Light brown wood.

76. *Azadaracta Indica.* Thembau-kamakah, *Burm.* or Neem, is plentiful in the Prome district only; it is a large, but soft timber, only fit for flooring. Light brown wood.

The above list embraces all the useful timber found in the Forests of the Pegu Province, except Teak. Besides timber well adapted for house-building, the list contains several promising kinds that have never yet been fairly tried for ship-building, and which in point of strength are equal to Teak or Oak. The timbers referred to more especially are Nos. 73, 68, 54, 55, 30 and 37, Nos. 25, 23, 19, 14 and 4 are also deserving of trial for ship-building, and No. 56 for any special purposes, where great strength and density are required. Until these trials are decided, the timber employed for house-building purposes should be restricted for other kinds.—*McClelland.*

(8211) *Penang Woods.*

The following Furniture woods grown in Penang or Prince of Wales' Island, were sent by the Singapore Committee to the Exhibition of 1851; viz. Siam wood: ebony; Wild Durian. Uncert[illegible]ngsena wood. Guava wood; Kamuning, Sen[illegible] Baymah or Ansena. Mirlimoh, two kinds. Baloh Bunga. Root of Betelnut tree. Root of Cocoanut tree. Clove wood. Root of Eboeh tree, Timbusu, Ranggas, Penang wood, Kulim Baloh, Ibool wood.

These arranged tabularly are,

1. Angsena, or senna Baymah.
2. Balah Bungah.
3. Balaeh.
4. Baloh.
5. Baloh Bungah.
6. Betel-nut tree root.
7. Clove tree.
8. Cocoa-nut tree root.
9. Durian (wild).
10. Eboeh-tree root.
11. Ebony.
12. Guava wood.
13. Ibool wood.
14. Kamuning.
15. Mirlimoh
16. Penang Wood.
17. Ranggas
18. Siam Wood.
19. Timbusi.

Woods of Penang (Col. Frith).

1 Brantey, Light brown colour. An inferior weak wood; used for building.

2 Bunho. A large tree; occasionally used for building.

3 Bintagon. A large tree; occasionally used for masts.

4 Curupas, dark red colour. Used for beams of houses.

5 Cooran, light brown colour. Used for planks for building.

6 Chinjeritt, brown colour, specific gravity 2.165. A small tree; used for furniture.

7 Cumpas, light brown colour. A large tree; used only for planks.

8 Cawa-Arang, pale brown colour. A very large tree; used for furniture and ornamental work.

9 Canis. A large tree; used for door frames.

10 Chiuracy, brown colour, specific gravity 1.081. Used for beams; does not work kindly.

11 Cawa-Arang, light brown colour. Only used for furniture.

12 Cocoa-nut, brown colour. Cut perpendicularly.

13 China red wood, red colour. Only used for furniture.

14 Ceylon ebony, black colour. Used for inlaying and ornamental furniture

15 Damarlout, brown colour. Used for building and general purposes.

16 Dunorhung, brown colour, specific gravity 1,235. Used by the Chinese for carved images.

17. Drum, light brown colour. A very small tree; used for ornamental furniture.

18 Hama Raja. A very small tree little used.

19 Maddang Kamenhir. Used by the Chinese for making boxes.

20 Miraban, light red colour. Much used for ship-building, furniture, &c.

21 Maddang Tandack, dark brown colour. Not used at all.

22 Maskaw, light brown colour; specific gravity 1 016. Used for plankeens, carriages, furniture &c.

23 Maukadu, brown colour. A species of Damarlout much used for beams.

24 Maliler, white colour. A small tree; used for work boxes and ornamental work.

25 Maribot, purple colour; specific gravity 0.939. A very large tree, difficult to work: used for furniture.

26 Mandara, pale red colour, specific gravity 0.939. A small tree; used for ornamental furniture.

27 Nebong, dark colour. A tall and thin, but straight tree; used for railings.

28 Papisrang, pale brown colour. Six to nine feet in circumference, forty feet long; not good for beams; chiefly used for furniture.

29 Pasa Linija, light brown colour. A large tree; used only for planks; soon decays.

30 Pala. A tall thin tree; used for planks.

31 Pinang Bach, brown colour. A large tree; used for beams.

32 Pala Utan, light brown colour. A large tree; only used for planks.

33 Papisrang, purple colour. A strong wood; used for beams.

34 Penang Teak, brown colour. Scarce now.

35 Penang Jack, yellow colour. Used only for ornamental furniture.

36 Rangha as, light brown colour. Used for furniture.

37 Rokam, light red colour. Used for boxes and furniture.

38 Red wood, red colour, specific gravity 1.000. In general use for furniture.

39 Sankuang, pale brown colour. Used only for ornamental work.

40 Satin wood, straw colour. A beautiful wood for ornamental furniture &c.

41 Siam ebony, black colour. Used only for ornamental furniture inlaying &c.

42 Teak, brown colour. In general use.

43 Tampinnis, light red colour. A fruit tree; used for ornamental furniture, billiard cues, &c.

44 Tija, light brown colour. Used for furniture boxes &c.

45 (No name), purple colour. Not durable; used for all sorts of rough work.

(8212) *Sinde. The forests of Sinde.*

During our sojourn in this Province we have often been struck with the beautiful and magnificent appearance of some of the Forests which are to be found scattered througout the country, particularly those in Lower Sind—the greater number of which are planted—not actual Forest. We need but ask our readers to pass over the Hills from Sonda en route to Jerruck, where beauty in its richest garb awaits them far beyond our description, with the noble river seen at the distance winding its way as it were through these gigantic woods; amazement here stops the traveller to enquire how scenery so transparently beautiful was ever formed for such an arid waste as Sind is supposed to be. We do not mean to say that there are not other parts equally picturesque; we know there are—but we allude to this spot from its proximity as well as to our remembrance of the "first impression" made years gone by, and which have been confirmed by subsequent visits year after year.

These Forests, under the rule of the Ameers, were mere hunting preserves, and were admirably adapted from the thickness of their underwood for the cover of wild animals of every sort, and no one but their keepers were allowed to enter them. No attention whatever was paid to their Timber, in fact they were hunting grounds *in reality*, and death to the man, in those days of oppression and tyranny, found in them, killing the "Lord's game."

From statistical Reports before us we gather that the Forests in number amount to about 72,

including the Forest jungles in Upper Sind (not walled in like those in Lower Sind) of Bhan or Poplar, which spring up spontaneously on the river bank when the inundation subsides. The Forests cover an area of about 1,59,688 acres, in the cultivation about 34,555, wasteland 55,385, and wood area 69,753.

The products of the Forests are Timber, Firewood, Charcoal, Gum Lac, Bark, Baubul Seeds, Grass and Reeds for Mats. The common woods found are Baubul, Bhan, Kunda, Tali, (Sissoo of Upper India) Tree Tamarisk, Jamul, Sirme and Mountain or bitter Neem.

The Baubul is very abundant and grows to a very large size. It is exceedingly hard and weighty. For agricultural implements and all native purposes it is excellent. It is also much used, we are informed, by the Indus Flotilla, for paddle flats, rudders, stanchions and boats' knees—in fact we believe it is used, for every purpose to which wood can be applied. Besides other parts of the Baubul are used, its bark is employed in tanning, its pods form a valuable food for the cattle, its young branches are the favourite food of camels and goats, its bark yields gum and lac, and for all these articles, wood, bark, pods and lac, a sale is always found.

The Kunda or Prosopis is very plentiful and only used as firewood.

The Bhan or Poplar is only used for rafters and turning work. It is nowhere to be found in the Bombay Presidency.

The Sirree or Madras Blackwood, the Tales or Blackwood of Upper India, the guz or Tree Tamarisk, are found in many of the Forests, but in small numbers.

The products of the Forests above enumerated are all consequent on our occupation of the country, and have conferred inestimable blessings on the people.

The grazing alone is much appreciated by the natives from its shade, and brings in a Revenue of between 8 to 9 thousand Rupees per annum. The supply of fuel to the Indus Flotilla must be enormous, 90,000 maunds per annum, and then there are the other products, giving we should say, a gross Revenue of not less than 20,000 Rupees, or thereabout. This in our opinion is underrating the Revenues of the Sind Forests, altho' it is said they are yearly diminishing in size from their being washed away by the encroachments of the river and from the Canals, which runs through them, not being cut as they used to be during the time of the Ameers, to admit water for watering the trees.

The superintendence of the Forests has passed through many hands since the beginning, but we believe none gave so much satisfaction as did Dr. Stock while they were under his management. For works of this description where improvements are so invaluable to the Revenues, men of first rate abilities are necessary. Botanical attainments as well as a general acquaintance with the prevailing Revenue system is desirable.—*Scindian, July* 12. 1856.

(8213) *Singapore Woods, or Malay Woods, being woods from Singapore.*

This collection, at the 1851 Exhibition, consisted of about one hundred specimens, many having no labels; those marked are as follows:

1 Angsanah.	17 Leban
2 Biliong.	18 Meosbon.
3 Biliong Wangi,	19 Medansi Miniak.
4 Bras Bras.	20 Medansi Buah yeah.
5 Bitangor Wood.	21 Medansi Tandoh.
6 Changis.	22 Medansi Kitanahan.
7 Glam.	23 Medansi Konit.
8 Jambu-ayer-utan.	24 Polai wood.
9 Kayau Arang.	25 Peragah.
10 Kamuning.	26 Ranggas,
11 Krautai.	27 Simpoh Ryah.
12 Arangi.	28 Simpoh brekit
13 Arangi Klat.	29 Slumar.
14 Kayu Brombong.	30 Tau Pang.
15 Kledang.	31 Tampinis.
16 Lakah wood.	32 Timbusu.

Of these "Binlangor" wood is the most used especially in ship building, serving for planks, masts, spars, &c. it grows in the greatest abundance round Singapore, and is largely exported to the Mauritius, California, &c.

The "Glam" tree, furnishes a paper-like bark, used in caulking the seams of vessels.

The wood of the "Polai" tree, which is used to make floats for fishing-nets, is a very remarkable light, white wood, and might probably be imported and used with advantage as a substitute for cork, and some similar substances.

(8214) *Tavoy. Timber Trees and Woods of Tavoy. (Dr. Wallich.)*

1 Acacia, Popeeah, *Burm.* A very large tree, used for posts and rollers
2 do Paingadoo, *Burm.*
3 Anacardium, Thubbamboo, *Burm.* A large tree, used in boat building.
4 Artocarpus, Thouenben, *Burm.* Do do do.
5 do A large tree.
6 do Pynyathe or tannabeng, *Burm.* Wood not used
7 Bignonia, Thathee, *Burm.* A very large tree.
8 do (?) Thuggainee *Burm.* A large tree used in building.
9 do Lainbha *Burm.* A middle-sized tree.
10 Calophyllum, Turra-phee, *Burm.* Used for masts &c.
11 Carapa, Taila-oon *Burm.* Used in building.
12 Careya, Kaga, *Burm.* Large timber tree.
13 Castanea Martabanica. Norne or zitha, *Burm.*
14 Cerbera Manghas, Kulloon, *Burm.* Wood not used.

15 Dillenia, Zimboon, *Burm.* Used in building.
16 Dipterocarpus grandiflora. Ain or aintha, *Burm.* An immense tree.
17 Do. Do. Do. Kunnean phin, *Burm.* Used as timber.
18 Euphorbiacea. Yamula, *Burm.* Used for frames of lacquered ware.
19 Eurya. Thaun, *Burm.* Used for fuel only.
20 Excoecaria? Thurrotha, *Burm.*
21 Ficus. Thubboo, *Burm.* Used in house carpentry.
22 Do. Do Do. Thuppan, *Burm.* Large tree; wood not used.
23 Garcinia. Pulloua, *Burm.* Large tree, used for posts, &c.
24 Grewia. Miaya, *Burm.*
25 Heritiera Fomes. Kunnazoo, *Burm.* Very large tree; very hard and durable wood.
26 Hibiscus macrophyllus. Used in building.
27 Do. Do. (?)
28 Hopea floribunda. Tantheya, *Burm.* A very large tree.
29 Lagerstroemia. Kuenmounee or puma, *Burm.* Used in building.
30 Laurus. Kullowa or Kurrowa, *Burm.*
31 Do. Panatha, *Burm.* Used in house-carpentry.
32 Do. Maythen, *Burm.* A large tree, good useful wood, much used.
33 Do. Keemna, *Burm.* Smalltree, used for posts
34 Laurus. Thuggoo, *Burm.* Used for oars, &c.
35 Do. Thitya, *Burm.* Very large tree, used in building, &c.
36 Do. Kayzai, *Burm.* Used in house-carpentry.
37 Mimusops, Thubbae, *Burm.* Used in ship-building.
38 Do. Elengi.
39 Murraya. Maikay, *Burm.* A tough close grained wood, used for handles.
40 Myristica, Thounsanga, *Burm.* A large tree, used in boat-building.
41 Do. Koathoe or Kunneen, *Burm.* A large tree, used in flooring houses.
42 Osyris peltata, Phaoun, *Burm.*
43 Pierardia, (?) Kunna or Kuzzo, *Burm.*
44 Pinus Dammara, *Burm.* A very large tree, used in building.
45 Pterocarpus, (?) Puddow, *Burm.* A large tree, used for furniture, &c.
46 Rottlera, Mimasko, *Burm.*
47 Do. Keoun lae, *Burm.* A large tree. used for rudders, &c.
48 Sandoricum, Thittoo, *Burm.* Used for furniture.
49 Sapotea, (?) Palaepean, *Burm.* A very large tree, used in building.
50 Sonneratia, (?) Thaumma, *Burm.* A small tree.
51 Sterculia, (?) Kununu, *Burm.* An enormous tree.
52 Do. Thikadoo, *Burm.*
53 Symplocos, (?) Kain-tha-phogee, *Burm.* Used in boat-building
54 Syndesmis Tavoy and, Ka-tha *Burm.* A very large tree, used for building, boxes, &c.
55 Do. Do. Kunnun keunka; Kunnun keunla, *Burm.* Used for beams, posts &c.
56 Terminalia. Thuphanga, *Burm.*
57 Ternstroemia. Puzzeen zwa, *Burm.* A large tree, used in building.
58 Uvaria. Thuhbor, *Burm* A large tree, used for boat building.
59 Wrightia antidysentrica. Lathou, *Burm.* Small tree, not used.
60 Xylocarpus. Keannan, *Burm.* Very durable timber.
61 Zizyphus. Zeethee, *Burm.* Hard and durable wood.
62———? Ahnaun, *Burm.* Strong, hard and very durable timber, used in ship-building.
63———? Bah-mah-thoa, *Burm.* Useful timber.
64———? Con-moo *Burm.* Good timber, used for building houses and boats.
65 ——— ? Kaantha, *Burm.* A small but valuable wood.
66———? Kaungo-kurrs A heavy but durable wood, used in boat building: specific gravity 0.690.
67———? Keahnaun, *Burm.* Strong crooked wood, used for stocks.
68———? Kuddoot alain, *Burm.* A large tree, used in house and ship building.
69———? Kuddoot-nu, *Burm.* Inferior wood, used in boat building.
70———? Kummi, *Burm.*
71———? Mainaban, *Burm.* Used for bows, lances, beams, rafters &c.
72———? May-klin, *Burm.* Used for rudders and anchors.
73———? May-maka, *Burm.* Used in ship-building.
74———? May-rang, *Burm.* Said to be very durable.
75———? May-tobek, *Burm.* Used for the bottoms of ships; preferred to teak.
76———? Megeone, *Burm.* A large tree used in building.
77———? Penlay-peen, *Burm.* Used in building.
78———? Pienmahne, *Burm.* Yields very strong knee-timber.
79———? Pienmah pue, *Burm.*
80———? Tantheya, *Burm.*
81———? Tangnet-na, *Burm.*
82———? Teatha, *Burm.*
83———? Thauga-et thittoo, *Burm.* Inferior wood.

84 ———? Thau-baunpo, *Burm.* Inferior wood, used for common canoes.

85 —— ? Thau baun thau-lay, *Burm.* Very flexible wood.

86 ———? Theyah, *Burm.* Inferior wood.

87 ———? Thounmynga, *Burm.* Used in building.

88 ——— ? Thymbro, *Burm* Good strong durable wood, used in boat buildiug.

89 ———? Town pine, *Burm.* Good wood, used in boat building.

(8215) *Tavoy, being Woods of Tavoy (by Mr. Blundell,) Commissioner.*

---

1 Annan. A small tree ; used for building.

2 Bep-than. Used for building.

3 Bep-won. Used for building.

4 Bhau-bhway. Used for house posts ; like sisoo

5 Bha-ta-ka. Used for common carpentry.

6 Daup-yan. Used for building.

7 Eng-beng. Strong wood ; used for common carpentry.

8 Kad-wot-nu, Cedrela ? *Burm.* Used for house and ship-building : large timber, 40 to 70 feet ; specific gravity 1.060.

9 Kanna-tso. A very tough close-grained wood.

10 Ka-nyeng kyaung khyay. Used for boat, ship, and house building ; yields an oil ; not attacked by insects.

11 do do do do rather shaky.

12 Ka-nyeng-pyan. A heavy, grey wood; used for handspikes.

13 Katso Like toon ; used in building &c.

14 Kaung-thmoo-ysepsay A rough, strong wood ; used for posts. &c.

15 Kengthep-guyung-ywept A light, inferior wood ; used in building.

16 Kengthep-pheoot-kyay. A sound small wood ; used in building.

17 Khamoung-nee. Heavy wood, not attacked by insects.

18 Khamoung-pyion. Small sized, compact, yellowish-grey wood.

19 Kharaway-nu. Porous, heavy, strong wood, not attacked by insects.

20 Kouk-ko. Employed for bottoms of boats.

21 Kyay-tsay-gyu-khy ay. A heavy, compact, dark wood ; suitable for gunstocks.

22 Kyay-tsay-bayoun. Useful for common carpentry.

23 Kyep-yo A kind of teak.

24 Kywon-bo. A soft wood like the nauclea.

25 Kywon-ma, do do ; a variety.

26 Lienman. A small tree ; heavy, close grained, light colored wood, like terminalia.

27 Mala-ka. Small sized, strong wood ; useful for handles.

28 Ma-yam. An indestructible, strong, heavy, dark red wood.

29 Mee-kyaung-kyay. A heavy wood, not attacked by insects.

30 Meep-thua-ban. A small-sized, compact, grey wood ; used for handles, &c.

31 Miaup-bout. Used for furniture, &c

32 Mya-kamaun. A valuable strong black wood ; used for knife handles.

33 Myeng-ta-bep. A strong, blueish-grey wood ; adapted for handles.

34 Ngoo-beng A strong wood ; used for posts and planking.

35 Noalee-lyeng. A close-grained, strong, heavy wood ; useful for handles.

36 Pan-loun. A close grained red wood ; used for building.

37 Pantheet-ya. A good white rough wood ; useful for boat building.

38 Patseng-tsway. Small sized strong wood.

39 Patseng-ngo. A superior high-coloured aromatic wood, like mahogany.

40 Peng-lay-byun. Small sized tough wood.

41 Peng-lay-oun. Strong, rough, red wood, like Mimosa serissa.

42 Peng-lay-kaboay. A heavy small sized wood ; suitable for handspikes, handles. &c.

43 Pee-daup. Mimosa. *Burm.*

44 Pinnay. Artocarpus. *Burm.* Strong, close grained yellow wood.

45 Pyaung-pyion. A compact, heavy, yellow wood.

46 Pyeng-khado. Small sized, heavy, close-grained, red wood

47 Tag-nyeng. A useful furniture wood.

48 Ta keep-nee. A very strong, close grained, heavy, light coloured wood.

49 Tha-bhan. Used for canoes.

50 Tha byay-nee. A strong, close grained, brownish grey wood ; used for house posts.

51 Tha-byoo. A heavy close-grained wood.

52 Theet-ta-gyee. Suitable for common carpentry.

53 Theet-ya-han. A close-grained teak, used for posts.

54 Theet-ya-nee. A close-grained brown wood ; rather shaky.

55 Theet-ya-pyion. A heavy strong wood.

56 Thiem. A serviceable wood.

57 Thingan-kyaup. A close-grained, heavy, strong wood ; used in ship and house-building, for carts &c.

58 Thmeng-ba. Like red Jarool ; used for posts and cotton-rollers.

59 Thmeny-tshout. A small, heavy, coarse, brown wood ; used for door frames and boat beams.

60 Toung[illegible]aut. Rough, knotty wood ; used for knife and spear-handles.

61 Toung-bhien. A light, porous wood ; used for common carpentry.

62 Toung-byeng. A kind of red saul.

63 Toung-byion. A close grained, brown, shaky wood.

64 Toung-kha-ray. Red Jarool; used in boat building.
65 Tseng byiou. A compact greyish-brown wood; suitable for common carpentry.
66 Tsoay-dau. Used for gun-stocks
67 Wonthay-khyay. A small, strong, compact, yellowish white wood.
68 Yow-ma-lay. A strong, heavy, rough, white wood; used for house-posts.
69 Zoo-lat. A small, heavy, compact, yellowish-white wood.

---

* (8216) *Tinnevelly. Woods of Tinnevelly by Colonel Frith.*

---

1 Arrava. Pentaptera, Light brown colour. Used for building, handspikes, tools, &c.,
2 Auttee, Red colour. Used for furniture.
3 Augeneepelah, Brown colour; specific gravity 0.484. General work.
4 Cangoo, whitish brown colour. Handspikes and wheel wright's work.
5 Eloopay, Red colour. Building in general.
6 Hill teak, Light brown colour. General purposes.
7 Karootauley, Black colour. Fancy work.
8 Koongheelyara, Light brown colour. Used for building purposes; yields dammer.
9 Kotamaram, Brown colour; specific gravity 0.723. Building in general.
10 Mookersey, Red colour. Building in general.
11 Munjet Kerddumpah, Light straw colour. Building in general.
12 Mathgirie vamboo, whitish brown colour. A strong light wood; used for general purposes.
13 Marootho, white brown colour. Building in general.
14 Mathgirie vamboo, old; Red colour. A strong light wood.
15 Naungoo, Red colour; specific gravity 1.009. Used for building, wheel wrights work, handspikes.
16 Nuffell; Red colour; specific gravity 0.717. Building in general.
17 Nelly, Light-brown colour. Building in general.
18 Nurryveroosoo, Whitish brown colour. Building in general
19 Nagakunny, Whitish brown colour. Building in general.
20 Oonnay, Red colour; specific gravity 0.928 A strong wood, used for wheelwright's work, handspikes.
21 Oosulay, Light brown colour; specific gravity 0·832; building in general.
22 Polava, Light brown colour, Musket-stocks, and building purposes.
23 Paulay, Deepstraw colour. Fancy work.
24 Pooversoo, Red colour; specific gravity 0.860. Used for making bandies.
25 Ponpathera, Whitey brown colour; specific gravity 0.683. Used for building purposes.
26 Poonnay, Deepstraw colour. Used for building purposes.
27 Poovey, Light brown colour; specific gravity 0·840. Used for building purposes.
28 Paselay, Whitey brown colour. Used for furniture.
29 Sammerm, Red colour. Furniture of any description.
30 Sarakontay, Whitey drown colour. Building in general
31 Sampayapaulay, Light brown colour, specific gravity 0·792. Building purposes.
32 Thothakutty, Red colour. Furniture of every description.
33 Thunnaka, Whitey brown colour. Making trunks.
34 Thokay, Red colour; specific gravity 0·950. Building purposes.
35 Yangy, Light brown colour. Wheelwright's work.
36 Yakauley, Light brown colour. Building in general.
37 Vamboo, Light straw colour; specific gravity 0·795. Building in general.
38 Vankay, Light brown colour; specific gravity 0·888. Building in general.
39 Veroosoo, Whitey brown colour. Building in general.
40 Vakanatty, Whitey brown colour, Building in general.
41 Vemmarm, Brown colour; specific gravity 0·786. Building in general.

(8217) *Travancore. Woods of Travancore by (Colonel Frith)*

---

1 Ahguilb. Light yellow colour, specific gravity 0.674. Very abundant; used for furniture.
2 Attoo vunjee. Amber colour, specific gravity 0·480. Very cheap; used for firewood.
3 Aranellah. Dark brown colour, specific gravity 0·645. For building common houses.
4 Chinny. Rather dark colour, specific gravity 0·515. From 8 to 16 feet in circumference; used for building canoes.
5 Cherrotimba. Dark colour, specific gravity 0·843. About 3 feet in circumference, used for house building, tools &c.
6 Cherrotanny, Light colour. Firewood.
7 Carcemaradoo Dark brown colour, 2 to 6 feet in circumference; used for carts and building.
8 Chorocadamboo, Yellow colour, specific gravity 0·529. Used for packing cases.
9 Chitta linny. Red colour, specific gravity 0·847, 1 to 1½ feet in circumference; used for furniture.
10 Cherro vunjee, Brown colour, specific gravity 0.644. Used for firewood.

11 Cherro nalampella, Light brown colour, specific gravity 0·483. For making canoes.

12 Cherro canny, Light brown colour. Only for firewood.

13 Cunda lah pallah, Bamboo colour. For making sandals.

14 Channy marm, Brown colour. For building common houses.

15 Channy vengah. Light yellow colour, 1 to 6 feet in circumference. House building.

16 Carrimarriddy, Dark colour, 1 to 4 feet in circumference ; used by wheel wrights.

17 Cherropoona, Dark colour. Building houses.

18 Conjah marm, Red colour. Furniture, &c.

19 Conjee marm, Light red colour, specific gravity 0·650. Furniture, &c.

20 Channee, Brown colour,Used for oil-mills, &c.

21 Dhannee, Dark colour, specific gravity 0·733.Very strong, but knotty, used for common buildings.

22 Ellahneel, Light red colour, specific gravity 0·779. A small tree, used for temples, pagodas, and furniture.

23 Eramboo, Dark brown. For common houses.

24 Jackwood, Yellow colour, specific gravity 0·554, 2 to 4 feet in cirumference, strong wood; used for furniture.

25 Kullentake, Brown colour, specific gravity 0·749. Buldings,wheel wright's work, &c.

26 Karanchilly, Dark colour, specific gravity 0·519. Buildings and small boats.

27 Kyeattee,Ash colour, specific gravity 0·972. Carts and buildings.

28 Kanjarum or nux vomica, Ash colour, specific gravity 0·796. For making cots.

29 Karity, or black wood, Black colour, specific gravity 0·948 ; 2 to 4 feet in circumference, strong wood; used for furniture.

30 Kanjarom, Ash colour. Used for common building.

31 Marya cadamba, Yellow colour. Used for packing-cases.

32 Moolu venga, Copper colour, specific gravity 0·831. Used for common buildings.

33 Masoodah, Ash colour, 2 to 8 feet in circumference ; used for building

34 Myle Ella, Ash colour. Used for carts, buildings &c.

35 Mally velly ravel, Light brown colour, specific gravity 0·664. For building houses only.

36 Munjaddy, Purple colour, specific gravity 0·667. For building houses only.

37 Myle ellah, Light green colour, specific gravity 0·896. For building houses only.

38 Manny marootha, Flesh colour. For carts and building houses.

39 Magadamboom, White colour, specific gravity 0·462. Used for light work generally.

40 Munny martha, Brown colour specific gravity 0·607. 1 to 6 feet in circumference ; used for furniture.

41 Manja cadamboo, Light yellow colour Used for packing-cases.

42 Muttalla, Brown colour. Used for light work.

43 Neelahampellah, Light brown colour Used for house building, ceilings, &c.

44 Nanamboo, Brown colour. Used for common buildings.

45 Neelumpallah, Light brown colour. Used for light work.

46 Nurmanjee, Bamboo colour. Used for light work.

47 Nurmarithy, Brown colour, specific gravity 0·615. Building common houses.

48 Nulampallah, Dark brown colour. 2 to 4 feet in circumference, and 30 feet long ; used for common houses and carts.

49 Odoorah venga, Dark brown colour, specific gravity 0·853. 4 feet in circumference, and 40 feet long ; a strong good wood, used for wheels gun carriages, &c.

50 Oddysaga, Dark brown colour. Used for common building purposes.

51 Oddamarm, Dark colour. 3 feet in circumference, used for tent-pegs, mallets, &c. very strong wood.

52 Paul-teak, Brown colour, specific gravity 0·739. Used for furniture, gun-carriages, &c.

53 Poon. Brown colour, specific gravity 0.623, 2 to 4 feet in circumference and 80 feet long ; used for masts.

54 Pongah. Brown colour, specific gravity 0.988. For building houses.

55 Poolyetty. Black colour, specific gravity 0.858, 2 to 8 feet in circumference, strong wood used for furniture.

56 Poody vaga, Brown colour, specific gravity 0.400, 4 to 10 feet in circumference,40 feet long strong, never splits ; used by wheelwrights.

57 Ponghu, Brown colour ; specific gravity 0.960, 3 feet in circumference,used for building

58 Thevahdarum, or cedar wood, Flesh colour specific gravity 0.457, 2 to 8 feet in circumference used for palanquins, cabin fittings, furniture &c.

59 Tharanchilly, Bamboo colour, 5 to 8 feet in circumference ; used for canoes only.

60 Tekkeer attovye anjelly. Brown colour specific gravity 0.528, 4 to 6 feet in circumference used for house and ship building.

61 Tharanjulla. Bamboo colour, specific gravity 0.576. Used for common building.

62 Tambagum. Brown colour, specific gravity 0.910, 5 feet in circumference; very strong wood ; used for houses, blocks &c.

63 Venpalla. Ash colour. Only used for carved figures, sandals &c.

64 Vatanboo, Brown colour, specific gravity 0,434. Only used for firewood.

65 Vatanboo. Light Brown colour, 2 feet in circumference ; used for railings, fences, &c.

66 Varoodah. Yellow colour, specific gravity 0.855. Used for building houses.

67 Velha ahguill, Light brown colour, 2 to 4 feet in circumference ; used for furniture.

68 Veytty. Light brown colour. Used for making carts, ceilings, &c.

69 Vaimboo, flesh colour, specific gravity 0.483, 2 to 4 feet in circumference ; used for tables &c.

70 Vellah ahguill, White colour, specific gravity 0.602, 2 feet in circumference ; 50 feet long ; used for furniture.

71 Vella carduntha, Brown colour, 3 to 6 feet in circumference, 40 feet long ; strong wood ; used for furniture.

72 Velty marm, Purple colour, specific gravity 0.623. Used only for firewood.

73 Vataloo. Purple colour. Used only for firewood.

74 Velty taddy, Brown colour, specific gravity 0.635. Used only for firewood.

75 Vanpuggalah, Light yellow colour, specific gravity 0.604. Used for light work.

76 Vutty marithy, Brown colour, specific gravity 0.595. Building common houses.

77 Vuddamba, Brown colour, specific gravity 0.750. Building common houses.

78 Vally canjarm, Brown colour ; specific gravity 0.703. Building common houses.

79 Vellaneermaradoo, Light yellow colour ; specific gravity 0.573. Used for furniture.

80 Vellallva, Brown colour. Used for light work.

81 Yuttamba, Brown colour. Used for building houses, and light work.

These Travancore woods as well as collections from Palamcottah, from Paulghaut, from Tinnevelly, from Canara and from Penang, were selected and sent to Britain by the late Colonel Frith ; they were exhibited at the London Exhibition of 1851 by Lieutenant Colonel Bonner, Military storekeeper of the Honorable East India Company.

(8218) TIN.

Reseas, Abruz, Arab.	Timmah Jav.
Yang-seih, Chin.	Stannum, Lat.
Tin, Dut.	Tima, Falagh. Mal.
Ferblanc, Fr.	Urzeez, Pers.
Blech, Weissblech, Ger.	Blacha, Rus.

	Tagarum, Tam.
	Kalai, Turk.

Tin is one of those metals which were earliest known, though it occurs in comparatively few countries. The acquaintance of the ancients with this metal, though it does not occur in the native state, is accounted for by the circumstances that the ore is found frequently near the surface, and is easily reduced by charcoal and a moderate degree of heat to the state of metal. According to Berzelius, Tin is found in England, Saxony, Bohemia, Hungary, the Isle of Banca, the Peninsula of Malacca, in Chili, and Mexico. Malacca furnishes the purest tin, and Cornwall the largest quantity. Tin occurs in two states of combination, the peroxide and double sulphuret of tin and copper : this last is rather a rare subatance, and it is from the former that the metal is almost entirely obtained. The Peroxide of Tin is found in Cornwall in two forms :—1. In veins in primitive countries, where it is intimately mixed with several other metals, as arsenic, copper, zinc, and tungsten : this is common *Tinstone*. 2. In loose rounded masses, grains, or sand in alluvial soil, in which state it is called *Stream-Tin*. The former, when reduced to the metallic state, yields *Block-Tin* ; while the latter yields *Grain-Tin*, which is the purer of the two. The massive varieties of Oxide of Tin are called Stream-Tin. What is termed *Wood-Tin* is found in reniform and botryoidal masses, or in wedge-shaped pieces, which have arisen from their partial destruction : the surfaces are generally water-worn. Wood-Tin exhibits various shades of brown, which sometimes appear in concentric bands, giving it a ligneous appearance, whence its name. Stream-Tin has evidently been derived from the destruction of tin veins or lodes, the lighter portions of stony matter having been carried away by the water, which has rounded the fragments of the ore. —*Eng. Cyc.* Tin is mentioned by Moses under the name Bedel. It was used by the Egyptians, probably obtained from the East by the trade with India. The Greeks and Romans obtained it through the Phœnicians from England. It abounds in Cornwall, and in the Eastern Archipelago, from Mergui to the island of Banca. It is brought into commerce in the form of Grain Tin and Block Tin. Malacca Tin and Banca Tin are the Eastern varieties ; to these Mergui Tin has lately been added.—*Royle.* It exists in large quantities in the Malayan Peninsula, as well as in Banca, Borneo, and many other islands. Tin, we know, was employed by the Egyptians, because it formed an ingredient in some of their metallic compounds ; but its use has long been familiar to the Hindoos for forming various metalurgical compounds, as well as for tinning copper. As it occurs as an oxide, and near the surface of the soil in large quantities, and requires only charcoal for reducing it, we may suppose it would easily have been discovered by a people who forged iron and made steel. As the nations of antiquity employed it for hardening copper, and used the alloy for forming swords and spear heads, so the natives of India form various compounds with copper and tin, which are remarkable for their hardness, and for the fine sounds, which they emit on being struck. Dr. Wight lately found that an alloy of ten grains

of copper to two and a half grains of tin was the best mixture which a native made in his presence. British spear heads are found to consist of one of tin to ten of copper, and a knife, of one of tin to seven and a half of copper. Mr. Aikin, in his experiments, found that eight grains of copper to one of tin formed the hardest alloy.—*Royle, Arts of India, page* 470.

Tin is abundant in the Tenasserim Provinces, commencing from the mountains in which the Tavoy and Henzai rivers have their rise. the northern limit of tin in the Provinces, to the southern boundary of Mergui, Pakchan river. The richest locality in the Province of Tavoy, is nearly opposite the city of Tavoy on the eastern side of the mountains. That large quantities of tin must have been found in Tavoy three hundred years ago, we have evidence in an incidental remark from Mr. Ralph Fitch ; who, says Mr. Hough in the Maulmain Chronicle, " travelled in this part of the world in about the year 1586, or 1587." He says : " I went from Pegu to Malacca passing many of the sea ports of Pegu as Martaban, the Island of Tavi whence all India is supplied with tin, Tenasserim, the island of Junkselon, and many others." Captain Tremenheere found the richest deposit of tin in the Provinces, at Kahan on Mergui Island, about eleven miles above the town, and near the Tenasserim river. " Kahan itself," he writes, " is the highest portion of a low ridge of hills, not more than 200 feet above the level of the river: it is composed of a soft friable white sandstone rock, the upper portions of which are decomposed and irregular. The surface gravel does not contain tin. It is found in the crystallized form interspersed in decomposed granite, forming a vein about three feet wide, which is enclosed by the white sandstone rock, and dips down at a high angle with the horizon. " Large scales of chlorite occur with it, which, as they are generally found where the tin is most abundant, is called by the natives ' the mother of tin.' The face of the hill is in one spot scattered over with these, which appear to have been brought down from the vein with other matter from which the tin has been separated by the usual mode of washing. It will be noticed, that the granite is completely decomposed, and that the crystals would be easily separated by washing. No tin has been raised here since the country came into our possession, but the locality has been known. It was worked during the Burmese rule, and valued as supplying the richest ore of tin. A Burmese residing near the spot, pointed out the place where his operations had ceased. He had followed the direction of the vein alluded to, as well as he was able, and had driven a gallery under ground in an inclined direction upwards, till the bank above fell in, when the mine was abandoned. He stated that he had procured considerable quantities of tin daily, and that he ofte found it in large masses mixed with yello ground. Arriving at the spot where his wor had terminated, I set people to excavate an find, if possible the vein which had been describ ed. It was reached after about two hours digging, at the depth of five feet from the sur face of the cut in the hill in which we stood. I about a quarter of an hour, a few baskets o the decomposed granite were removed down th hill, from which an amount of the crystallize peroxide of tin, equal to 63.176 grains of pur tin, were collected. " The crystallized form i which the ore is here found renders its separa tion extremely easy, and the whole processes o stamping and dressing, which in England ar tedious and expensive operations, can thus b dispensed with. No arsenic or sulphur bein mixed with the ore, it need not be roasted befor it is placed in the furnace." This ore he adds, a quoted by Mr. O'Riley, " contains specimens o macled crystals, which in weight and siz surpass any thing I have ever seen in Cornwall or in cabinet specimens. Specimens have bee extracted of great weight and richness, consist ing of large macled crystals of tin on quartz and containing more tin in proportion to the bulk ing than any specimens I have before seen. Th largest, which measured about fourteen inche square by twelve deep, was so heavy, as t require some exertion to hold it steady in both hands." In another report, Captain Tremen here writes : " With the view of ascertaining its value in the home market, I transmitted, a box of average samples of the ore, to a smelt ing establishment in Cornwall, (Messrs. Bolitho and Co.) having extensive connection with the tin mines of that country. In April 1843 Mr. Thomas Bolitho informed me that—' The samples of once-washed ore produce about 70 per cent. of tin, and the twice-washed yields nearly 75 per cent. The metal is very good being almost free from alloy ; some of the samples which have been sent to me from the Malayan peninsula contain titanium. The ore appears to separate from the matrix very easily The consumption of tin throughout the world increases so slowly, and the supply at present being more than equal to the demand, there is little inducement to speculate in tin mines The produce of Cornwall is 6,000 tons per annum, and we calculate that the quantity produced at Java together with what is raised in the Malayan peninsula, will rather exceed the produce of Cornwall. The average price of tin in Cornwall has been about 72s. per cwt., but it is now as low as 56s., which is the present price of the best Straits tin, and tin mines are suffering greatly from the depreciation in the value of their metal. It may serve for your guidance to know, that at this moment tin ore of the description of the sample twice washed, would fetch in

England about £ 46 per ton.' "The following calculations of the probable result of a shipment of tin ore and of the metal, have been obligingly made by two mercantile gentlemen of Maulmain. They are based on the lowest prices which, according to Mr. Bolitho, were obtainable in the market in April 1843, and show a probable profit on tin ore of 7s. 8d. per cwt.; but a loss on shipment of the metal of 12s. 4d. per cwt. in one case, and 4s. 9d. per cwt in the other.

"The assumed rate for the ore at Maulmain, 45 rupees per 365 lbs, would be, I think, subject to a reduction; but that for the metal, is probably the lowest average. It will be observed also, that the London price of 56s. per cwt. is taken at a period of great depression in the value of the article which had averaged 72s. per cwt.; but it would nevertheless appear, that to send it to England in the state of clean ore would be by far the safest investment" The richest tin locality in the Province of Tavoy is at the base of the eastern mountains, where the vallies are covered with a thick bed of diluvial pebbles and boulders, eight or ten feet thick, below which no tin is found.—*Mason.*

The Malay and Javanese term for tin "*timah*," is a word used in the Archipelago, as a generic term for both tin and lead, the epithet "white," or "flowery,"—"putih" and "*sari*," being given to tin itself, and that of "blank," "*itam*," to lead, a metal with which, being entirely a foreign product, the Malayan nations are but little acquainted. What may be called the Malayan tin district, or tin field, is, beyond all comparison, the most extensive and the richest in the world, for it stretches from Tavoy, in the 14° of north latitude, to Billiton, in the 3° of south latitude, that is, over seventeen degrees of latitude, and ten of longitude. Tin has been found or worked in a great many localities within these wide bounds, as in the British territory of the Tenasserim coast,—in the Siamese island of Junk-Ceylon,—in various parts of the continental territories of the Malayan states, and in several of the islands at the eastern end of the Straits of Malacca. The ore would seem only to become the more abundant as it approaches its termination at Banca and Billiton. The localities richest in tin are ascertained to be those near the junction of the sandstone with the granite, and all the countries rich in tin are also observed to be so in iron. All the ore heretofore worked, it should be noticed, has been found in the alluvium, or detritus of ancient mountains,—what is called in mining language "stream-works,"—obtained, in fact, by washing the soil in the same manner as, for the most part, gold in Australia and California; for no ore has ever been obtained by mining the rock containing veins of it, although it has been traced to them. It must also be remembered that the greater part of the tin district is covered with an immense forest, and has not been explored, so that tin may reasonably be expected to be found

in many situations which have hitherto remained unexamined. The supply of tin from the Malayan countries promises to last for at least as many ages as that of the coal of England. It is produced, in fact, in quantity proportionate to the labour and capital invested in working it, and without restriction from any other cause. With partial exceptions, the Chinese are at present the effectual miners and smelters, and the increase which has taken place in the quantity produced is remarkable. In the beginning of the present century the quantity yielded by Banca did not exceed 560 tons, and at present, increasing yearly, it is not less than 5540 tons. Yet the mines of Banca have now been worked for near a century and a half, being stated to have been first discovered only in the first years of the eighteenth century. The tin mines of Malacca were not worked at all, until as late as 1793, and not effectually by Chinese until 1840, but in 1848 they yielded, paying a seignorage of a tenth to the state, better than 250 tons. The production in the neighbouring Malay states had also greatly increased, so that the whole quantity exported from Malacca amounted in that year to above 960 tons. Mr. Logan estimates the whole quantity produced in the Malay Peninsula at about 2350 tons, exclusive of the produce of the Siamese territory; and when this is added to the produce of Banca, namely, 5540 tons, we have an aggregate annual yield of 7890 tons, or, making but a moderate allowance for the produce of the Siamese mines, of which we have no estimate, probably not less than double the amount of the tin of Cornwall. Probably, not less than five sixths of this amount have been brought into existence in the course of the present century. The price has not fallen with this new supply to the market, and as in the case of the gold of California and Australia, it may be asked how this has happened, and the answer must be the same, that new sources of consumption have been found, increased wealth and population keeping the demand equal to the supply.—*Crawfurd Dict. p.* 435. The *Tin* found in the island of Banca is very abundant and of a pure quality. It is cast into ingots weighing from 20 to 60 lbs; the purity of these bars is superior to those from the mines in Malacca. All that is of a superior quality which is brought to China in bars, is called 'Banca tin,' while the inferior is known as 'Straits tin.' Complaints have been made that both are adulterated with lead. The former sells for about 17 £ and the latter for 14 or 15 £ a pecul; the consumption of foreign tin has decreased during the last few years, and the annual importation does not now reach 5000 peculs. Tin plates are brought from England and America in boxes, containing 112 lbs. or from 80 to 120 plates, and sell for about 10 £ per box.—*Morrison.*

(8219) TINFOIL,

Beggud. Guz. Hind.

Is tin rolled into thin sheets, and employed with the addition of mercury, to cover the surface of glass, thus forming looking glasses, mirrors, &c.—*Joyce's Chem. Min.*

(8220) TIRYAQ FAROOQ.

Tiriyaq Farooq, also Tiriya pharka, Arab.	Treeyaq or Tiriyaq. Hind.

Dr. Irvine states that, as met with in Ajmere, this is a black extract (most likely extract of henbane) of a narcotic odour: imported via Bombay, carefully packed in a small tin box: a powerful stimulant and is given in a sort of convulsive disorder called "seet," (catalepsy): one tola costs six or eight Rupees.—*Genl. Med. Top. p.* 152. It is, however, the celebrated Theriaca Andromachi, of which the *Teucrium chamædrys*, the common Germander forms an ingredient. The words however are merely the Arabic for the best sorts of treacle, and this substance being esteemed in Baghdad as an antidote for snake bites, *Tiryaq* has come to be applied as a general term for antidote. The substance is in much request in Beri-beri.

Tobacco was introduced to Europe from the New World about the middle of the 16th century, and is now extensively cultivated in most parts of the world.

Tobacco, as it occurs in commerce, is of a yellowish-brown colour, soft and pliable, a little clammy, with something of a honey, mixed with a narcotic, odour; the latter, however, is not obvious in the fresh leaves. The taste is bitter, acrid, and nauseous. Virginian Tobacco, though the strongest, is best adapted for medical use, in order to observe uniformity of strength. Its active properties are taken up by water, Spirit, and Wine, but are destroyed by heat. Tobacco was elaborately analysed by Vauquelin. Most of the Tobacco of commerce, as that of Virginia, is yielded by N. Tabacum, as is that of India. Small Havannah cigars are said to be formed of the leaves of *N. repanda*; the Syrian and Turkish Tobaccos by *N. rustica* and the fine Shiraz Tobacco by *N. persica*, Lind.

In N. tabacum the Root fibrous. Stem erect, branched, and viscid, from 2 to 6 feet high. Leaves sessile, oblong, lanceolate, the lower ones decurrent, very large, a little hairy, viscid. Flowers in terminal panicles. Bracts linear-acute. Calyx tubular, swelling. 5-cleft, hairy, glutinous. Corol rose-coloured, funnel-shaped, throat inflated, ventricose, limb spreading, plicate, with 5-cleft acuminate segments. Stamens 5, declinate. Ovary ovate. Style long. Stigma emarginate. Capsule usually 2-celled, 2-valved opening crosswise at top, valves finally bifid. Seeds numerous, small, kidney-shaped, attached to fleshy placentæ.—Warm parts of America, but now cultivated in most parts of the world.—Nees von E. 194. St. and Ch. 37.—*Royle.*

We refer however to the articles "Nicotiana" for lengthened observations on the several species of this genus, and merely name here those considered as the sources af the Tobacco of Commerce. According to Loudon ("Encyc. of Plants"), there are fourteen species of this genus, besides varieties.

a. N. tabacum a native of several parts of America, but principally known as Virginian tobacco, having a stem rising from four to six feet, or more in height, bearing pink flowers. Of this there are three chief varieties known in America by the popular names of Orinoco, Broad-leaved and Narrow-leaved. Lindley enumerates eight varieties of N. tabacum.

b. N. macrophylla or large leaved tobacco, an ornamental annual, also with pink flowers, native of America, which rises to the height of six feet.

c. N. fruticosa, or shrubby tobacco, an ornamental evergreen shrub, native of China, with pink blossoms, which grows to about three feet.

d. N. undulata, or *suaveolens*, sweet-scented or New Holland tobacco, a green house perennial, native of New South Wales, with white flowers, which is only two feet high.

e. N. rustica.—The common green or English tobacco, an annual plant, native of America, producing white flowers, which seldom grows higher than three feet.

f. N. paniculata, or panicled tobacco, an annual plant bearing greenish yellow flowers, native of Peru, rises to the height of three feet.

g. N. glutinosa or clammy-leaved tobacco, also an annual plant, native of Peru, growing to the height of four feet, with bright scarlet flowers.

h. N. plumbaginifolia, or curled-leaved tobacco, an ornamental deciduous annual, native of America, with white blossoms, rising to the height of two feet.

i. N. pusilla, or primrose-leaved tobacco, an ornamental deciduous biennial, with white flowers, native of Vera Cruz, rising to three feet.

j. N. quadrivalvis, four-valved, or Missouri tobacco, an ornamental annual, native of North America, with white flowers, seldom growing higher than two feet.

k. N. nana, or Rocky Mount tobacco, a curious greenhouse annual, native of North America, with white blossoms, rising only three inches high.

l, N. Langsdorffii, or Langsdorff's tobacco, an ornamental annual, with greenish yellow flowers, native of Chili, reaching five feet high.

m. N. Corinthoides, or honey wort tobacco, an ornamental annual, with greenish yellow flowers, native country unknown.

n. N. repanda, Havanna tobacco, an annual with white flowers, native of Cuba. rising two feet high.

There are a few species, native of the Province of Buenos Ayres, which may be particularised *N. bonariensis*, having white flowers, *N. glauca*, yellowish green flowers; *N. longiflora*, white flowers, and *N. viscosa*, pink flowers.

The important mineral substances present in Havanna tobacco, examined by Hertung, are in 100 parts of ashes,

Salts of potash, ...	34·15
Salts of lime, ...	51·38
Magnesia, ...	4·09
Phosphates, ...	9·04

These substances were for the most part insoluble in earth, and must have been dissolved during the growth of the crop.

There is no doubt that the manure which contains the largest proportion of alkaline carbonate, magnesia, lime snd gypsum, is that best adapted for tobacco. I give an analysis taken from Prof. Johnston's "Lectures," (2nd edition) of the ash of the tobacco leaf and the composition of a special manure for tobacco:—

Potash....	12 14	All the ingredients which are necessary to replace 100 lbs. of the ash of tobacco leaves are present in the following Mixture:—
Soda	0 07	
Lime	45.90	
Magnesia.	13.09	
Chloride of Sodium ...	3.49	
Chloride of potassium...	8.98	Bone dust, sulphuric acid 23lbs
Phosphate of iron ...	5.48	Carbonate of potash (dry) 31 „
Phosphate of lime. ...	1.49	Carbonate of soda (dry) 5 „
Sulphate of lime... ...	6 35	Carbonate of Magnesia 25 „
Silica	8.01	Carbonate of lime (chalk) 60 „
	100.00	144 lbs.

The following is the result of an analysis of the fresh leaves of tobacco, by Posselt and Reimann ("Mag. Pharm." xxiv. xxv):—

Nicotine, ...	0·06
Nicotianine, ...	0·01
Extractive matter, slightly bitter, ...	2·37
Gum, with a little malate of lime, ...	1·14
Green resin, ...	0·26
Vegetable albumen, ...	0·26
Substance analogous to gluten, ...	1·04
Malic acid, ...	0·51
Malate of ammonia, ...	0·12
Sulphate of potash, ...	0·04
Chloride of potassium, ...	0·06
Potash combined with malic and nitric acids,	0·90

Woody fibre,...	4·96
Water (traces of starch),...	87·21
	100 1

Dr. Covell, in "Silliman's American Journal," vol, vii., shows its components to have been but imperfectly represented in the above German analysis. He found in tobacco by chemical examination—1, gum; 2, a viscid slime, equally soluble in water and alcohol, and precipitable from both by subacetate of lead; 3, tannin; 4, gallic acid; 5, chlorophyle (leaf green); 6, a green pulverulent matter, which dissolves in boiling water, but falls down again when the water cools; 7, a yellow oil, possessing the smell, taste and poisonous qualities of tobacco; 8, a large quantity of a pale yellow resin; 9, nicotine; 10, white substance, analogous to morphia, soluble in hot, but hardly in cold alcohol; 11, a beautiful orange red dye stuff, soluble only in acids; it deflagrates in the fire, and seems to possess neutral properties; 12, nicotianine. According to Buchner, the seeds of tobacco yield a pale yellow extract to alcohol, which contains a compound of nicotine and sugar. M. M. Henery and Boutron Charlard found in 100 parts of

Cuba tobacco.....	8·64 of nicotine.

quantities from 12 to 19 times more than were obtained by Posselt and Reimann.—("*Ure's Dictionary of Arts and Manufactures.*") The army of smokers in Great Britain and Ireland consume yearly about six millions of pounds worth of tobacco. The duty alone paid upon snuff and tobacco for the people of Great Britain, averages four-and-a-half millions sterling a year! The quantity consumed—smoked, snuffed, or chewed—during the same period, is about 28 millions of pounds weight, or about four pounds weight per annum for every male adult. Ireland annually pays not less than £800,000 of duty on tobacco and snuff, and only about £30,000 on coffee. For every pound of coffee that the Irish people use, they smoke away about *four pounds of tobacco.* North America produces annually upwards of 200 million pounds. The combustion of the mass of vegetable material used in this kingdom would yield about 340 million pounds of carbonic acid gas; so that the yearly produce of carbonic acid gas from tobacco smoking alone cannot be less than 1,000,000,000 lbs.—a large contribution to the annual demand for this gas made upon the atmosphere for the vegetation of the world. Henceforth let no one twit the smoker with idleness and unimportance. Every pipe is an agricultural furnace,—every

smoker a manufacturer of vegetation,—the consumer of a weed that he may rear more largely his own provisions. In the year 1842, 605,000,000 of cigars were made in the German Commercial Union. In 1839, the revenue on tobacco in Great Britain was about £3,600,000. Of this it has been estimated eleven-twelfths are drawn from the working classes, and one-twelfth from the richer classes. The following is a calculation of the consumption of tobacco per head of the population, estimated from the number of pounds on which duty was paid :—

	Rate of duty.	Consumption per head. oz.
1801	1s. 7 3-10d. England. 1s. 0 7-10d. Ireland.	 17
1811	2s. 2 13-20d.	... . 19½
1821	4s. 0d.	... . 11 45
1831	3s. 0d.	..... 12 35
1841	3s 1 8-10d.	..... 12 45
1851	3s. 1 4 5d.	 21

Thus it will be seen the consumption is materially affected by the rate of duty.

The imports into England of all kinds of tobacco for the five years 1848 to 1852, have been as follows :—

	1848.	1849.	1850.	1851.	1852.
Unmanufactured.....	lbs. 34,090,360	lbs. 41,546,848	lbs. 35,166,358	lbs. 31,061,953	lbs. 33,205,635
Manufacture and snuff,...	1,512,714	1,905,306	1,557,518	2,331,886	2,930,299
	35,603,074	43,452,154	36,723,876	33,393,839	36,135,934
Gross duty received :—	1848.	1849.	1850.	1851.	1852.
On raw tobacco.....	£ 4,267,579	£ 4,328,217	£ 4,337,258	£ 4,386,910	£ 4,466,533

Culture in Connecticut.—Seed bed made rich and sown as cabbage as early in April as possible. Land well ploughed and manured and harrowed as for corn, laid out in rows three feet apart, and slight hills in the row about two and a-half feet apart; begin to plant about 10th of June, the ground to be kept clean with hoe and cultivator, and examine the plants and keep clear of worms. When in blossom and before seed is formed, the plants must be topped about thirty-two inches from the ground, having from sixteen to twenty leaves on each stalk, after this the suckers are broken off, and the plants kept clean till cut. When ripe the leaves are spotted, thick, and will crack when pressed between the fingers and thumb. It is cut at any time of the day, after the dew is off, left in the row till wilted, then turned, and if there is a hot sun, it is often turned to prevent burning; after wilting it is put into small heaps of six or eight plants, then carried to the tobacco house for hanging, usually on poles twelve feet long; hung with twine about forty plants to a pole, twenty on each side, crossing the pole with a hitch knot to the stump end of the plants; when perfectly cured, which is known by the stems of the leaves being completely dry, it is then taken in a damp time, when the leaves will not crumble, from the poles, and placed in large piles, by letting the tops of the plants lap each other, leaving the butts out; it remains in these heaps from three to ten days before it is stripped, depending on the state of weather, but it must not be allowed to heat. When stripped it is made into small hands, the small and broken leaves to be kept by themselves; it is then packed in boxes of about 400 lbs. and marked "Seed, Leaf Tobacco." One acre of tobacco will require as much labor as two of corn that produce 60 bags to the acre, and requires about the same quantity of manure If the tobacco can be cured without fire heat the quality will be improved, and if dried in the open air, should have shades of boards to keep off rain and excess of sun. The chief market for Connecticut tobacco is Bremen. In a number of the "Charleston Southern Planter." a remedy is described for preventing the destruction of plants by the fly. The writer says: "I had a bushel or two of dry ashes put into a large tub, and added train oil enough (say one gallon of oil to the bushel of ashes) to damp and flavor the ashes completely: this was well stirred and mixed with the hand, and sown broadcast over certain patches, and proved thoroughly effectual for several years, while parts left without the remedy were destroyed." The best ground for raising the plant, according to Capt. Carver ("Treatise on Culture of Tobacco," &c.), is a warm rich soil, not subject to be overrun with weeds. The soil in which it grows in Virginia is inclining to sandy, consequently warm and light; the nearer, therefore, the nature of the land approaches to that, the greater probabability there is of its flourishing. The situation most preferable for a plantation is the southern declivity of a hill, or a spot sheltered from the blighting north winds. But at the same time the plants must enjoy a free current of air; for if that be obstructed they will not prosper. The different sorts of seed not being distinguishable from each other, nor the goodness to be ascertained by its appearance, great caution should be used in obtaining the seed through some responsible mercantile house, or individual of character. Each capsule contains about a thousand seeds, and the whole produce of a single plant has been estimated at 350,000. The seeds are usually ripe in the month of September, and when perfectly dry may be rubbed out and preserved in bags till the following season.

Culture of Tobacco in the East.—We will now notice the method pursued in cultivating and curing the celebrated Shiraz tobacco of Persia (*Nicotiana Persica*), which is so much esteemed for the delicacy of its flavor, and its aromatic quality. It is thus described by an intelligent traveller. The culture of the plant, is nearly the same; it is only the preparation of the tobacco that forms the difference :—

In December the seed is sown in a dark soil, which has been slightly manured (red clayey soils will not do). To protect the seed and to keep it warm, the ground is coverd with light, thorny bushes, which are removed when the plants are three or four inches high; and during this period the plants are watered every four or five days only however in the event of sufficient rain to keep the soil well moistened not falling. The

ground must be kept until the plants are six to eight inches high, when they are transplanted into a well moistened soil, which has been made into trenches for them; the plants being put on the top of the ridges ten or twelve inches apart, while the trenched plots are made, so as to retain the water given. The day they are transplanted, water must be given to them, and also every five or six days subsequently, unless rain enough falls to render this unnecessary. When the plants have become from thirty to forty inches high, the leaves will be from three to fifteen inches long. At this period, or when the flowers are forming, all the flower capsules are pinched or twisted off. After this operation and watering being continued, the leaves increase in size and thickness until the month of August or September, when each plant is cut off close to the root, and again stuck firmly into the ground. At this season of the year, heavy dews fall during the night; when exposed to these the color of the leaves change from green to the desired yellow. During this stage, of course no water is given to the soil. When the leaves are sufficiently yellow, the plants are taken from the earth early in the morning, and while they are yet wet from the dew, are heaped on each other in a high shed, the walls of which are made with light thorny bushes, where they are freely exposed to the wind. While there, and generally in four or five days, those leaves which are still green become of the desired pale yellow color. The stalks and centre stem of each leaf are now removed, and thrown away, the leaves are heaped together in the drying house for three or four days more, when they are in a fit state for packing. For this operation the leaves are carefully spread on each other and formed into cakes of sorts, the circumference from four to five feet, and three to four inches thick, great care being taken not to break or injure the leaves. Bags made of strong cloth, but thin and very open at the sides, are filled with these cakes, and pressed very strongly down on each other; the leaves would be broken if this were not attended to. When the bags are filled, they are placed separately in a drying house, and turned daily. If the leaves were so dry that there would be a risk of their breaking during the operation of packing, a very slight sprinkling of water is given them to enable them to withstand it without injury. The leaf is valued for being thick, tough, and of a uniform light yellow colour, and of an agreeable aromatic smell.

In *India*, the Surat, Bilsah, and Sandoway (Arracan) varieties of tobacco are the most celebrated. The two first are found to be good for cultivation in the district about Calcutta, but the Cabool is still more to be preferred. Tobacco requires in the East, for its growth, a soil as fertile and as well manured as for the production of the poppy or opium. It is, therefore, often planted in the spaces enriched b animal and vegetable exuviæ, among the huts c the natives. I have tried seed in different soil says Capt. C. Cowles,—namely a light garde mould with a large portion of old house rubbis dug to a good depth, which had a top dressing c the sweepings of the farm-yard and cow-houses a rather heavy loam, highly manured with burn and decayed vegetables, and old cow dung; th third was a patch of ground, which was orgin ally an unwholesome swamp, from being eighteei inches to two feet, lower than the surroundin land; the soil appeared to be a hard sterile clay and covered with long coarse grass and rushes As there was a tank near it, I cut away on side of it, and threw the soil over the ground bringing it rather above the level. Such wa its appearance, (a hard compost marly clay,) tha I expected, no other good from it than that o raising the land so as to throw the water off contrary, however, to my expectations, it pro duced a much finer crop of tobacco than eithe of the other soils, and with somewhat less man ure. The agricultural process is limited to some practical laws founded on experience, and these are subject to two principal agents; viz. the soil and climate. With respect to the former, it is the practice amongst the growers in tobacco countries, such as Cuba, the States of Virginia, North and South Carolina, and the Philippine Islands, to select a high and dry piece of land, of a siliceous nature, and combined with iron, if possible; and with respect to the latter, there are seasons of the year too well known to the planters to need any explanation. The only difference (if there is any) depends on the geographical situation of the place, with respect to its temperature, or in the backwardness or advancement of seasons, and even on the duration of the same—in which circumstances the planter takes advantage of the one for the other.

The influence of a burning climate may be modified by choosing the coolest month of the year, whereas the soil cannot be altered without incurring great expense. I have seen tobacco lose its natural quality and degenerate by transplanting from one soil to another, although of the same temperature, and *vice versa*.

Mr. Piddington has analysed several Indian soils, distinguished for the production of superior tobacco. These are in the table soils from Arracan, (Sandoway,) a soil from Singour, in Burdwan, near Chandernagore, the tobacco of which, though of the same species as that of the surrounding country, sells at the price of the Arracan sorts; and the soil of the best Bengal tobcaco, which is grown at, and about Hingalee, in the Kishnagur district.

The best tobacco soils of Cuba and Manila, are for the most part red soils. Now, the red and reddish soils contain most of their iron in the state of peroxide, or the reddish brown oxide of

iron; while the lighter grey soils contain it only in the state of protoxide, or the black oxide of iron. Mr. Piddington believes the quality of the tobacco to depend mainly on the state and quantity of the iron of the soil, while it is indifferent about the lime, which is so essential to cotton. None of the tobacco soils contain any lime. Their analysis show them to contain:—

	Arracan soil.	Singour soil.	Hingalee soil.
Oxide or iron, (peroxide)	15·65	10·60	6·00
Water and saline matter	1·10	75	1 50
Vegetable matter and fibre	3·75	1·10	75
Silex	76·90	80·65	87·25
Alumina	2·00	4·50	1·50
	99·40	97·60	97·00
Water and loss	60	2·40	3·00
	100	100	100

From which it will be seen that the best tobacco soil hitherto found in India contains about sixteen per cent., or nearly one sixth, of iron, which is mostly in a state of peroxide; and that the inferior sort of tobacco grows in a soil containing only six per cent., or one-sixteenth of iron, which is, moreover, mostly in the state of protoxide, or black oxide. Mr. Piddington thought it worth examining what the quantity of iron in the different sorts of tobacco would be, and found that while the ashes of one ounce, or 480 grains of Havana and Sandoway cheroots gave exactly 1·94 grains, or 0.40 per cent., of peroxide of iron, the ashes of the same quantity of the Hingalee, or best Bengal tobacco, only gave 1·50 grains, or 0 32 per cent; and it appears to exist in the first two in a state of peroxide, and in the last as a protoxide of iron; rendering it highly probable that the flavor of the tobacco to the smoker depends on the state and quantity of the iron it contains! Green copperas water, which is a solution of sulphate of iron, is often used by the American and English tobacconists and planters, to colour and flavor their tobacco; and this would be decomposed by the potass of the tobacco, and sulphate of potass and carbonate of iron is formed. Carbonate of iron is of an ochre-yellow colour. Mr Piddington says he took care to ascertain that this process had not been performed with the tobacco used for this experiment; and adds that Bengal cheroot makers do not know of this method. Mr. Laidley, of Gonitea, dissents from the idea suggested by Mr. Piddington that ferruginous matter in the soil is essential to the successful growth of tobacco. He observes that if we attend only to the iron contained, why every plant will be found to require a ferruginous soil; but tobacco contains a notable quantity of nitrate of potass and muriate of ammonia (the latter a most rare ingredient in plants), and these two salts are infinitely more likely to affect the flavor of the leaf than a small portion of oxide of iron, an inert body. Now as neither of these can be supplied by the atmosphere, we must search for them in the soil, and accordingly he imagined that a compost similar to the saltpetre beds which Napoleon employed so extensively in France, would be a good manure for tobacco lands; namely, calcareous matter, such as old mortar, dung, and the ashes of weeds or wood. He was aware that good tobacco might be grown in Beerbhoom, having raised some himself several years ago from American seed. The plants grew most vigorously, and he further observed, in confirmation of his opinion about the proper manure, that in other districts in which he had resided the natives always grew the tobacco (each for his own use) upon the heap of rubbish at his door, consisting of ashes, cow-dung, and offal of all kinds. While the soils of the Gangetic diluvium almost always contains carbonate of lime, the Beerbhoom soil does not, as far at least as Mr. Laidley had examined it. The following is the mode of culture pursued about the city of Coimbatore. Between the middle of August and the same time in September, a plot of ground is hoed and embanked into small squares; in these the seed is sown, and covered by hand three times at intervals of ten days. To secure a succession of seedlings water is then given, and the sun's rays moderated by a covering of bushes. Watering is repeated every day for a month, and then only every fifth day. The field in which the seedlings are transplanted, is manured and ploughed at the end of August. Cattle are also folded upon the ground. Four or five ploughings are given between mid September and the middle of October, when the field is divided as above into small squares. These are watered until the soil is rendered a mud. Plants of the first sowing are then inserted at the end of September, about a cubit apart, the transplanting being done in the afternoon. At intervals of ten days the seedlings of the other two sowings are removed. A month after being transplanted the field is hoed, and after another month the leading shoot of each plant is pinched off, so as to leave them not more than a cubit high. Three times during the next month all side shoots thrown out are removed. When four months old, the crop is ready for cutting. To render the leaves sweet the field is watered, and the plants cut down close to the surface, being allowed to remain when cut until next morning. Their roots are tied to a rope and suspended round the hedges. In fine weather the leaves are dry in ten days, but if cloudy they require five more days. They are then heaped up under a roof, which is covered with bushes and pressed with stones for five days. After this the leaves are removed from the stems, tied in bunches, heaped again, and pressed for four days longer. They are now tied in bundles partly of the small leaf and partly of the large

leaf bundles, and again put in heaps for ten days—once during the time the heaps being opened and piled afresh. This completes the drying. A thousand bundles, weighing about 570 lbs., is a good produce for an acre.

Ceylon.—In 1760, Ceylon produced a considerable quantity of tobacco, principally about Jaffna, a demand having sprung up for it in Travancore, and on the Malay coast. The cultivation spread to other districts of the island. Negombo, Chilaw, and Matura. Not long after the possession of the island by the British, a monopoly was created by an import duty of 25 per cent, *ad valorem*, and in 1811 the growers were compelled to deliver their tobacco into the Government stores at certain fixed rates. The culture and demand thereupon decreased. In 1843, the duty on the exports of tobacco from this island amounted to £8,386, and in 1836 to £9,514. Ceylon now exports a considerable quantity of tobacco. The value of that exported in 1844 was nearly £18,000: it went exclusively to British colonies. The shipments since have been as follows :—

1848	£17,992		———
1849	22,300		———
1850	20,721		22,184 cwts.
1851	21,422		22,523 ,,
1852	20,531		21,955 ,,

Archipelago, Siam, Philippines, Manilla.—About 96,000 piculs of cigars, of five different qualities, are exported annually from Siam. A good deal of very fine tobacco is grown in the Philippines, and the Manila cheroots are celebrated all over the globe. The quantity of raw tobacco shipped from Manila in 1847 was 92,106 arrobas (each about a quarter of a cwt); manufactured tobacco, 12,054 arrobas; and 1,933 cases of cigars. 5,220 boxes of cigars were shipped from Manila in 1844. 73,439 millions of cigars were shipped in 1850, and 42,629 quintals of leaf tobacco. The manufacture of cigars in Manila is a monopoly of the government, and not only is this the case, but it is a monopoly of the closest description, and any infringement of the assumed rights of the Spanish Indian government is visited by the most severe penalties. Public enterprise, however little of that commodity there now exists in the Spanish character, is thus kept down; and this is not only detrimental to the nation itself, but is also unjust towards those persons who are the purchasers of the article, enhanced in price, as is always the case, by monopoly. The cheroot, which now costs, free of duty, about one halfpenny, could be rendered for half that sum, according to well-authenticated opinions. To protect itself from illicit manufacturers, or smuggling of any kind in connection with cigars, the government is compelled to maintain an army of gendarmes, in order to adopt the most stringent means which despotic states alone tolerate. No person is, therefore, permitted to have even the tobacco leaf in its raw state on his premises, and gendarmes pay, at stated intervals, domiciliary visits to the habitations of the people, in search of any contraband materials. There are several extensive manufactories of cigars and cheroots belonging to the government in and near Manila. Mr. MacMicking, in his recent work on the Philippines, thus describes the mode of manufacture by those employed by the government :—In making cheroots women only are employed, the number of those so engaged in the factory at Manila being generally about 4,000. Beside these, a large body of men are employed at another place in the composition of cigarillos, or small cigars, kept together by an envelope of white paper in place of tobacco; these being the description most smoked by the Indians. The flavor of Manila cheroots is peculiar to themselves, being quite different from that made of of any other sort of tobacco; the greatest characteristic probably being its slightly soporific tendency, which has caused many persons in the habit of using it to imagine that opium is employed in the preparatory treatment of the tobacco, which, however, is not the case. The cigars are made up by the hands of women in large rooms of the factory, each of them containing from 8: 0 to 1,000 souls. These are all seated, or squatted, Indian like, on their haunches, upon the floor, round tables, at each of which there is an old woman presiding to keep the young ones in order, about a dozen of them being the complement of a table. All of them are supplied with a certain weight of tobacco, of the first, second, or third qualities used in composing a cigar, and are obliged to account for a proportionate number of cheroots, the weight and size of which are by these means kept equal. As they use stones for beating out the leaf on the wooden tables before which they are seated, the noise produced by them while making them up is deafening, and generally sufficient to make one not desirous of protracting a visit to the place. The workers are well recompensed by the government, as very many of them earn from six to ten dollars a month for their labor; and as that amount is amply sufficient to provide them with all their comforts, and to leave a large balance for their expenses in dress, &c., they are seldom very constant laborers, and never enter the factory on Sundays, or, at least, on as great an annual number of feast days as there are Sundays in a year.

The *Japanese* grow a good deal of tobacco for their own consumption, which is very considerable. They consider that from Sasma as the best, then that from Nangasakay, Sinday, &c. The worst comes from the province of Tzyngaru; it is strong, of a black colour, and has a disgusting taste and smell. The tobacco from Sasma is, indeed, also strong, but it has an agreeable taste

d smell, and is of a bright yellow color. The bacco from Naugasakay is very weak, in taste d smell perhaps the best, and of a bright own color. The tobacco from Sinday is very od. The Japanese manufacture the tobacco well, says Capt. Golownin, (Recollections of pan,) that though I was before no friend smoking, and even when I was at Jamaica uld but seldom persuade myself to smoke an avana cigar, yet I smoked the Japanese to-acco very frequently, and with great pleasure.

Java.—The culture of tobacco is a very profi-ble article for the laborers, seeing that the pro-uce is obtained from grounds which have ready given the first crop. The qualities of ava tobacco are more and more prized in ie European markets, the preparation and ssortment are not yet all that could be de-ired, but they have progressed in this branch, nd the contracts made with the new adven-urers assure them of a considerable benefit. But efore the Java tobacco can find an assured pening in the European markets, it is necessary hat the cultivators should make use of seed rom the Havana Manila. The residencies of Cembang, Sourabaya, Samarang, Chinbou, and Pagal, present districts suited for its culture; t has been carried on with success for a good nany years in the residencies of Treanger, Paka-ongan, and Kedu, but only for the consumption of the interior, and of the Archipelago.

Celebes.—Tobacco is cultivated in Celebes, but merely in sufficient quantity for local con-sumption. It is exclusively grown by the Bantik population—the mode of preparation s the same as in Java; it is chopped very fine and mostly flavored with arrack. When bought in large quantities, it may be had for thirty cents the pound; but in smaller quanti-ties it costs double that price.

Australia.—Tobacco is cultivated in New South Wales with much success. Australia produces a leaf equal to Virginia, or the most fertile parts of Kentucky, but the great difficulty is to extract the superabundant "nitre." The first crop in New South Wales exceeds one ton per acre, and the second crop of the same plants, yields about half the weight of the first. In 1844 there were about 871 acres in cultivation in New South Wales with tobacco, and the produce was returned at 6,382 cwts. In New England, New South Wales, as fine a "fig" as could be wished for is manufactured under the superintendence of a through-bred Virginia tobacco manufacturer—but the impos-sibility of extracting the nitre by the heating, or any other process, renders the flavor rank and disagreeable. Perhaps cheroots,, or the lower numbers of cigars, manufactured from the Australian leaf, might prove more successful.—*Simmonds, p. 590 to 621.*

Culture of Tabacco in India.—The tobacco of Chunar, on the Ganges, and more especially that of Bhilsa, near Nagpore, are celebrated throughout India, while Dr. Ainslie states, that "the finest kinds in India, and perhaps in the world, are grown near the village of Wood-anum, in the Northern Circars, and in some of those low sandy islands formed at the mouths of the river Krishna, (from this is made the famous Masulipatam snuff,) also in the Delta of the Godavery, where the soil is peculiarly rich and fertile," the product being known as Lunka tobacco. Mr. Ritchie, in his Evidence before the Committee of the House of Commons, in 1831, stated, that Tobacco of very fine quality is produced extensively in Guzerat, and the northern districts of the Bombay Presi-dency. One bale imported, sold higher than any American, as it brought 6*d.* when the latter was sold for 5*d.* a pound; but the average of an experimental exportation was found to be defec-tive in the curing, and did not pay, Excellent Tobacco is grown at Sandaway, in Arracan, and when this was brought to London it was valued at from 6*d.* to 8*d.* a pound. Mr. Piddington mentions the Tobacco of Singour, in Burdwan, near Chandernagur, as selling at the price of the Arracan sort, though of the same species as that cultivated in the surrounding country; and that the best Bengal tobacco is grown at and about Hanglee, in the Kisnagar district. The kinds of Tobacco cultivated, vary according to situation and the mode of culture. Some distinct species are also cultivated in different countries, but Nicotiana tabacum and its varie-ties are so, most extensively. N. rustica is chiefly cultivated in western Africa and Egypt, also near Salonica and Latakia, and likewise in some parts of Europe. Dr. Lindley considers the Persian Tobacco to be a distinct species, which he has named N. persica. The seed of these several species is well worthy of trial in different parts of India, as well as seed from those places which are already celebrated for their tobacco, as Dr. Royle has already re-commended in his article on this subject.

Arracan Tobacco.—One of the results of Dr. Wallich's investigations was the bringing to notice some very superior Tobacco, which obtained the name of Martaban Tobacco. Dr. Wallich states, that 'the sort is from Arracan and not from Martaban;' and describes it as having 'a fine silky leaf: tried by many people, it had been pronounced the very best they had ever tasted, equal to, nay surpassing, the finest imported from Turkey and Persia.' An extensive Tobac-conist says, 'a finer and better-flavoured Tobac-co he never saw or tasted in his life.' One of the first brokers in the City says, 'the sample of leaf Tobacco is certainly of a very fine quality, and appears to have been produced from some peculiar seed and a greatly-improved cultivation

and cure.' By many manufacturers 'it was supposed to be from the seed of Havannah or St. Domingo Tobacco.' For smoking, it is compared with Maryland Tobacco, having the same qualities, 'except the flavour, which is better, and more like Havannah.' The colour and leaf are moreover, pronounced excellent for cigar-making; 'but if anything is against it for that purpose, it is the largeness of the principal stalk, and coarseness of the small fibres in the leaf.'—*Royle's Productive Resources of India.*

Godavery.—For Lanka segars, the *Nicotiana rustica* is grown on the islets of the Godavery, where the cultivation is rapidly increasing; these are a superior article.—*M.E.J.R.* The Tobacco of the Godavery lunkas, or islands of the Godavery, is rather famous. The tobacco generally produced in India is generally complained of as too high dried and fit only for inferior kinds of snuff. The tobacco most celebrated among cigar smokers in the Madras presidency appears to be the Trichinopoly, and the Lanka or that produced on the islands in the Godavery and Kristna: from the latter the Masuli patam snuff is manufactured. A high value was put on specimens of tobacco from American seed produced in Calcutta. There appears the certainty that India can produce as good tobacco as America with the same care in the selection of situation in cultivation, preparation, and packing. It is only necessary to refer to the improvements that have been introduced in the cultivation and production of silk, indigo, cotton, and to be able to appreciate the probable benefit of similar attempts in improving tobacco. The value of good tobacco in the District of Masulipatam is from 10 to 15 rupees a candy of 500 lbs or about ½*d* per lb. The best Lanka tobacco is from the Seetanagram island near Gootala in the Godavery and is sold usually at 40 rupees a candy on the spot. It has increased to this price within two years from 15 Rupees.—*Rohde M.S.S.*

Tenasserim Tobacco is more universally used in Burmah, than it perhaps ever was in its native country. The Karens raise it for their own consumption, and the Burmese both cultivate it, and import it from Rangoon.—*Mason.*

(8222) TOBAGO CANES. This walking stick is a product of a palm, the Bactris minor, *Jacq.*, a native of New Granada and the West Indies —*Seeman.*

(8223) TODACUTTIE WOOD.

Todacuttie marum, TAM.

This beautiful, hard, and compact wood, which is, in some parts of the country, called Nookoo marum, is occasionally employed for making escretoires, cabinets &c. &c.—*Ains. Mat. Med. p.* 207.

(8224) TODDALIA, a genus of Plants belonging to the natural order *Rutaceæ* tribe *Xanthoxyleæ*, which is itself sometimes made into an order. The name *Toddalia* is derived from Toddali, the Malabar name of one of the species. The genus is distinguished by having unisexual flowers, the calyx 5-toothed; petals 5; stamens 5, longer than the petals; stigma almost sessile, peltate; fruit fleshy, 5-furrowed, 5-celled, cells 1-seeded; seed kidney-shaped; embryo arched.—*Eng. Cyc.* An inferior cosmetic wood or cosmestic tubercles, is seen in the Tenasserim market, which is the tubercle of some plant, probably Toddalia aculeata or T. floribunda. The Burmese appear, from their name, to regard them as produced by a species of erythrina, for they call them "erythrina thorns;" but Mr. Mason knows the plant to be a creeper, and suspects that it is of the above genus.

(8225) TODDALIA ACULEATA. *Syn.* Scopolia aculeata, Roxb. vol i. 616.

Kaka toddali, TAM. | Conda cashinda, TEL.

Toddalia aculeata has prickly stems and branches, and extends to 30° N. lat., along the jungly base of the Himalayan Mountains. The bark and root of this species are said to be used as a cure for the remittent fever of such situations; and as many of the allied plants are possessed of bitter with aromatic properties, it is probable that this plant also may be useful for such purposes—*Eng. Cyc.* This is one of the most common bushes on the coast of Coromandel, and Dr. Roxburgh mentions that every part of this shrub has a strong pungent taste and that the roots when fresh cut smell particularly so. The fresh leaves are eaten raw for pains in the bowels; the ripe berries are fully as pungent as black pepper, and with nearly the same kind of pungency; from these the natives prepare an excellent pickle. The fresh bark of the root is administered by the Telinga physicians for the cure of that sort of remittent commonly called the "hill fever." Roxburgh says, "I conceive every part of this plant to be possessed of strong stimulating powers, and have no doubt, but that under proper management it might prove a valuable medicine where stimulants are required." The bark of the Toddalia deserves most careful trial, and will in all probability be found a very valuable medicine.—*O'Shaughnessy, page* 265. A tincture of Toddalia aculeata, is a powerful stimulant and diaphoretic, also considered tonic and febrifuge. Dose, one to three fluid drachms. This bark is a native remedy of high repute in the treatment of the collapse from jungle fever.—*Beng. Phar. p.* 433. The most recent notice of this drug is to be found at page 395 of Indian Annals of Medical science. *Toddalia aculeata* and *Toddalia floribunda.* An inferior cosmetic wood is seen in market, which is the tubercle of some plant. The Burmese appear, from their name, to regard them as produced by a species of erythrina, for they call them "erythrina thorns;" but Mr. Mason knows the

plant to be a creeper, and suspects that it is of the above genus.

(8226) TODDY.

Toddy, Neera Saindee, Maree, Sur Duk. Guz. Hind.	Sura, Tari, Tadi, Sans. Khulloo, Tam. Khulloo Tel.

Toddy is the general name given by Europeans to those sweet, delicious, refreshing liquors, which are procured in the tropics, by wounding the *spathe* &c. of certain palms, when the juice exudes and drops into earthen pots, which are attached to the stem to receive it. Taken fresh from the tree, early in the morning, before the sun is up, it forms a most pleasant and delicious drink. Its chief use, however, is for making the fermented intoxicating fluid, as also arrack, sugar, and vinegar.—*Faulkner*. Toddy, as above stated, is the sap and juices which exude from the trunks or from the fruit stalks of several kinds of palm trees, and is a product peculiar to tropical countries. In the West Indies, it is obtained from the trunk of the Attalea cohune, a native of the Isthmus of Panama. In Eastern Asia, the palms from which it is prepared are the Gomuti palm, the Cocoanut, the Palmyra, the Date and the Kittul or Caryota urens.

The Gomuti Palm, *Arenga Saccharifera*, is fit to yield toddy when nine or ten years old, and continues to yield for two years, at the average rate of three quarts a day. On the first appearance of the fruit, one of the spadices is beaten with a short stick, on three successive days, with the view of determining the sap to the wounded part. The spadix is cut off a little way from its root or base, and the liquor, which pours out, is received in pots of earthen ware, in bamboos, or other vessels. When newly drawn, the liquor is clear, and in taste resembling fresh must. In a very short time it becomes turbid, whitish, and somewhat acid, and quickly runs into the various states of fermentation acquiring an intoxicating quality. In Malacca, the Gomuti termed Kabong, comes in bearing after the seventh year. It produces two kinds of Mayams spadices,—male and female. The female spadix yields fruit, but no juice, and the male *vice versa*.

To procure the Toddy of the Palmyra tree, the Borassus flabelliformis, at the season when the inflorescence begins to appear, and before the spathes have had time to burst, the toddy drawer cuts off all leaves except three or four of the leaves, and all or most of the spathes are effectually encompassed from end to end, by thongs, to prevent the inflorescence from bursting forth. When thus tied for three successive mornings they are beaten or crushed between the wooden battens, with the object of keeping them from bursting and to encourage the flow of sap. On the fourth morning, a thin slice is cut from the parts of the spathes. On the eighth morning a clear sweet liquor begins to flow from the wounded parts, and the toddy drawer then ascends in the morning with chatties, or toddy receivers, in which he places the ends of the spathes, and leaves them until the morning, when they are found to contain a quantity of this liquor. The operation of attracting the juice is repeated every morning or evening until the whole spathe is sliced away. The trees are drained in this manner, for several months of the year, seven or eight spathes yielding at the same time.

The Toddy of the Cocoa-nut Tree (*Cocos nucifera*) is obtained from the flower spathes before the flowers have expanded in a manner almost similar to what has been described for the Palmyra palm.—The spathe is tied with strips of the young leaves, to prevent its expansion; it is cut a little transversely from the top, and beaten either with the handle of the toddy knife or a piece of hard wood, a process which is repeated morning and evening for five or six days, in succession, the under part of the spathe is taken off, to allow of its being bent, in which position it is retained by being attached to a leaf-stalk below. An earthen pot or leaf basket, is a few days afterwards attached to the end, and is every morning and evening emptied of the toddy which exudes into it, the quantity of which greatly varies A little portion of the spathe is daily cut off.

Toddy is also procured from the "*Date Tree*" of India "*Phœnix dactylifera*," during the months of November, December, January and February, during which period each tree is reckoned to yield from 120 to 240 pints of juice. but the mode of its extraction destroys both the fertility and the appearance of the tree. After removing the lower leaves and their sheaths, a notch is cut in the pith of the tree near the top, from which the toddy issues by a small channel, made of a bit of the Palmyra leaf, into a pot suspended to receive it.

Palm Wine is also extracted from the Caryota urens during the hot season. The quantities which are said to flow from it are immense, so much as a hundred pints during the twenty four hours.

The taste of Toddy in its fresh state, probably varies according to the state of the weather and season of the year, which will explain the many comparisons given of it, to Poubon water, mild champagne; cider, ginger beer, perry, &c. In all Eastern countries, the toddy of these several trees is used for the same purposes. It is drank, though rarely, when fresh from the tree, and is then a gentle aperient particularly useful in delicate constitutions. It is boiled down into a sugar called Jaggery or *Goor* which is afterwards refined. It is fermented in the course of a day, into a mildly intoxicating liquor, still known as toddy, of which several pints are partaken before intoxica-

tion comes on. It is also distilled into arrack, made into vinegar, and throughout all Eastern countries it is employed as yeast as it begins to ferment in a few hours after it is drawn. In the peninsula of India the ropes employed by the toddy drawers to help them to climb the tree, are made of cow or buffalo hide, but in other countries the pliant tendrils of plants are sometimes employed. The ropes are sufficiently large to surround the tree and the body of the climber, who by leaning backwards and throwing his whole weight on the rope, is thus enabled to retain the position he has taken up, while by drawing up his feet and shifting the thong in his hand to higher points, he gradually raises himself to the top of the tree. Accidents however are frequent and frightful.

(8227) TOLU BALSAM, SAINT THOMAS'S BALSAM.

Baume de Tolu, FR,	Balsamo de Tolu, SP.
Tolubalsamischer balsam GER.	

The concrete juice of the *Myroxylon toluiferum*, is of a brownish-yellow colour, transparent, with the taste and odour of the white balsam of Peru. It is obtained from America.—*Faulkner.*

(8228) TOMATOES. SOLANUM LYCOPERSICUM. A well known vegetable of easy culture, does not require a very rich soil, succeeds best when trained on horizontal trellises, should be thinned occasionally of superfluous shoots, raised from seed, used in sauces, &c.—*Jaffrey.* See LOVE APPLE SOLANUM.

(8229) TONGLO. Barometrical observations taken simultaneously with those of Calcutta, give the height of Tonglo in Southern Sikkim as 10,078·3 feet. Colonel Waugh's, by trigonometry, 10,070·4 feet—a remarkable and unusual coincidence.—*Hooker, Him. Jour. Vol.* I. *p.* 171.

(8230) TONKIN BEANS. Are oval, oblong, somewhat boat-shaped seeds, from one to two inches long, shining, with an oily surface marked with a network of wrinkles; colour, purple-brown, odour very fragrant; taste slightly bitter, but very burning and almost caustic. They are only employed as a perfume for snuff. The plant (*Dipteryx odorata*), is a native of the woods of Guiana.—*Faulkner.*

(8231) TOOLSEE, [illegible] is the name given in India, to the Ocymum [illegible]osum. Toolsee was a disciple of Vishnu. [illegible]ming to be his wife, she excited the jealousy of Lukshmee, by whom she was transformed into the herb named after her. There are, however, several well known species of the genus Ocymum, to each of which different names are given, viz. the *Ram Toolsee*, is the Ocymum gratissimum; *Babooye Toolsee*, Ocymum pilosum; the *Krishna Toolsee*, Ocymum sanctum; but only the last and the common Toolsee, O. villosum, are held to be sacred to Vishnoo and used in his worship. See OCYMUM.

(8232) TOON-WOOD. CEDRELA TOONA, has already been mentioned under that head, also of Cedar, as being similar to the so-called Havannah cedar, the Cedrela odorata. The toon-tree is C. toona; its wood is of a reddish-brown colour, rather cross grained, but much used all over India for furniture and cabinet-work.—*Holtz* Lieut. Nuthall, as quoted by Captain Munro, mentions "*toon*" as one of the woods of Arracan, under the name of "thit-ka-do." We have, however, the authority of Wallich for saying that thit-ka-do is a species of sterculia, a genus that produces no valuable timber. Still, as it is possible that there may be only a mistake in the name while the thing itself exists, the remark is worth putting on record.—*Mason.*

(8233) TOOTEE, is the long silky hemp like fibre of three species of Abutilon, the A. tomentosum. A. polyandrum and A. indicum.

(8234) TOPAZ.

Poosperagam, TAM.	Topase, FR,
Purperagan, CYNG.	Topas GER.
Pokhraj, HIND.	Topazio, IT.
Zuburjud, PERS.	Topas, RUS.
Topaz, ARAB.	Topacio, SP.

Topaz occurs massive, in imbedded and rounded crystals. Primary form a right rhombic prism. Cleavage easy, parallel to the base of the primary form, more difficult in the direction of its lateral faces. Structure lamellar at right angles to the axis of the prism. Fracture uneven, rightly conchoidal. Hardness; scratches quartz. Electricity; positive by friction; those crystals which possess different faces of crystallisation at opposite ends acquire different kinds of electricity at the two extremities when heated. Colour white, yellow, bluish, and greenish. Lustre vitreous transparent, translucent. Specific gravity 3.499. Fragments exposed to heat emit a blue, green, or yellowish phosphoric light. By the blowpipe on charcoal it does not fuse, but with borax it melts into a transparent glass. Topazes occur generally in primitive rocks, and in many parts of the world, as Cornwall, Scotland, Saxony, Siberia, Brazil, &c. The following analyses have been given of this mineral: (1) Saxon topaz by Klaproth; (2) Brazilian topaz by Klaproth; (3) Saxon topaz by Berzelius; (4) Brazilian topaz by Berzelius:—

	(1)	(2)	(3)	(4)
Silica..	25	44 5	34·24	34·01
Alumina...	56	47·5	57·45	58·38
Fluoric Acid ...	5	7 0	7·75	7·79
Oxide of Iron, ..	—	0·5	—	—
	99	90·5	99·44	100·18

The ancient *Topazion* was found on an island in the Red Sea, which was often surrounded with fog, and therefore difficult to find. It was hence named from 'topazo,' to seek. This name, like most of the mineralogical terms of the ancients, was applied to several distinct spe-

s. Pliny describes a statue of Arsinoe, wife Ptolemy Philadelphus, four cubits high, ich was made of topazion, or topaz, but evi-ntly not the topaz of the present day, nor rysolite, which has been supposed to be the cient topaz. It has been conjectured that it is a jasper or agate; others have imagined it be prase, or chrysoprase. Topaz is employed jewellery, and for this purpose its colour is en altered by heat. The variety from Brazil sumes a pink or red hue, so nearly resem-ing the Balas ruby, that it can only distinguished by the facility with which becomes electric by friction. The finest ystals for the lapidary are brought from inas Novas, in Brazil. From their peculiar npidity, topaz-pebbles are sometimes denomi-ted Gouttes d'Eau. When cut with facets d set in rings, they are readily mistaken, if ewed by daylight, for diamonds. The coarse rieties of topaz may be employed as a substi-te for emery in grinding and polishing hard bstances. Topaz is cut on a leaden wheel, d is polished on a copper wheel with rotten one. It is usually cut in the form of the bril-ant or table, and is set either with gold foil or or à jour.' The white and rose-red are most steemed. (Dana, *Manual of Mineralogy*,)—*Eng. yc.*

Beautiful Topazes of various kinds are found the Burmah dominions and in Ceylon, in hich last mentioned country, a genuine greenish ellow coloured Topaz is improperly called, hunberg tells us, the yellow Tourmalin (Kane-e Turemale, *Cyng*), a light coloured smoky To-az is there as improperly called a yellow crystal Kaha Palingu, *Cyng.*) and a dark coloured smoky Topaz is mistaken for a brown Crystal, and call-Tillia Palingu by the Cyngalese.

Oriental Topazes are a variety of the genuine erfect Corundum and are said by Mineralogists o differ from the Occidental Topaz or that which omes from Saxony and Siberia by the latter con-aining a greater proportion of Silex.—*Ains. Mat Med. page* 167.

(8235) TORENIA, a genus of Plants of the natural family of *Scrophulariaceæ*, found in India, the tropical parts of Australia, and in South America. *T. Asiatica*, a species found in almost every part of India, is described by Rheede as having the juice of its leaves em-ployed as a cure for gonorrhœa on the coast of Malabar.—*Eng Cyc.*

(8236) *Torenia asiatica*, Linn. (Caela dola, *Sans.*) the juice of the leaves is considered in Malabar a remedy for gonorrhœa —*O'Shaugh-nessy, page* 477.

(8237) TORPEDINIDÆ, the Torpedoes, a family of Fishes belonging to the order *Plagios-tomi*, and the sub-order *Raiinæ*.

Torpedo, the principal genus, was founded by Dumeril upon the *Raia Torpedo* of Linnæus, and some other species, distinguished by their having the tail short and moderately thick, and the disc of the body nearly circular, the anterior margin being formed by two produced portions from the head, which, inclining sideways, join the pec-torals: the space between the head, the pectoral fins, and the branchiæ is occupied by small ver-tical hexagonal tubes, which are filled with mucous matter, and largely provided with nerves from the eighth pair. The situation of these honeycomb-like cells, which constitute the electrical apparatus, is indicated on the upper surface by a slight convexity on each side of the head. Cuvier and Risso consider that several species have been confounded under a common name, and the latter of these authors has char-acterised four species of *Torpedo* in his 'Histoire Naturelle del'Europe Meridionale.' They are—

1. *Torpedo Narke*, which he describes as being yellowish-red above, and having five ocel-lated spots

2. *Torpedo unimaculata*. This species has the body above fulvous, spotted with whitish spots, and one oblong ocellated spot in the middle of the back. The tail is more elongated and slender. It is said to have the electrical apparatus scarcely visible, and to give but very slight shocks.

3. *Torpedo marmorata*. Body flesh-coloured, and having brown spots and sinuous markings, producing a marbled appearance: tail thick above rounded.

4. *Torpedo Galvani*. Body fulvous, imma-culate, but margined with black. Fleming refers the British Torpedo to the third of these species *Torpedo marmorata.—Eng. Cyc.*

(8238) TORPEDO. [TORPEDINIDÆ.]

(8239) TORS. By the natural weathering of rocks exposed to atmospheric vicissitudes, the perishable parts are removed and the more resisting portions remain. In rocks which manifest peculiar arrangements of joints or natural divisions, the blocks and masses defined by their intersections often appear in cubical, subcolumnar and other characteristic shapes. To masses more or less characteristic in figure, left by the decay of surrounding parts in pro-minent situations, the name of 'Tor' is applied in the granitic tracts of Devon and Cornwall.—*Eng Cyc.* Tors are of very frequent occurrence in the granitic tracts of Southern India, where, as in Hyderabad in the Dekhan and in the Ceded Districts, the piled up masses often are seen assuming the appearances of artificial structures.

(8240) TORTOISE SHELL.

Ecaille de tortue, FR.	Sisik Kurakura also Sisik panu. MAL.
Schilpad, GER	Scaglia de Tartaruga, IT.
Kachakra, GUZ. HIND.	

The scales of the tortoise; extensively used in the manufacture of combs, snuff-boxes, in in-laying, &c. The goodness of tortoise shell depends mainly on the thickness and [illegible] of the

scales, and partly on the clearness and brilliancy of the colours. Tortoise shell abounds in the seas of the Indian Archipelago, which is considered superior to that obtained from Singapore, the African Coast, the West Indies, and the Laccadive and Maldive Islands.—*Faulkner.* In Ceylon the marginal pieces of tortoise shell are used at Point de Galle in the manufacture of bracelets and necklaces formed of a chain of shell, it resembles amber in appearance; these bear a higher price than such as are formed by the darker shell. In Ceylon there is a great demand for tortoise-shell for the manufacture of Combs which are worn by males as well as females among the Cyngalese. In the numerous excesses into which English costume has been carried the size of the back comb worn by ladies has never attained that of the Cingalese men, who also wear a narrow long bent Comb across the forepart of the head—the lighter coloured shell is most esteemed by them. Five pounds is a moderate price for a tortoise shell back comb, which increases in value according to the size and quality of the shell: hair pins of tortoise-shell are worn by the women: gold and silver being substituted for full dress: these hair pins are among the articles purchased by passengers in the steam-boats.—*Rhode, M. S. S.*

For the Malay Tortoise-shell "*Sisik-panu,*" is literally, "tortoise scales." The only part of the sea tortoises or turtles held of much value by the natives of the Indian islands is the shell. Tortoises are found in all the seas of the Malay and Philippine Archipelagos, but the imbricated kind that yields the finest shell is most abundant in those of Celebes and the Spice Islands, as far as the coast of new Guinea. The parties chiefly engaged in their capture are the Rajahs or Malay sea nomadic hunters, of whom the turtle is the principal game. These people distinguish four species of sea-turtles to which they give the names of kulitan akung, ratu, and boko. The last is the panu of the Malays and the green esculent turtle, of which the carapace is of no use, the animal being valued only for its flesh to sell to the Chinese and Europeans, for among the Mahomedans it is unlawful food. The three first named species all yield a marketable shell. The ratu, which signifies king or royal turtle, is said to be of great size, measuring from five to six feet in length, but is not often taken, and the shell is of inferior value. All the finest shell is afforded by the first, the kulitan, the name, in fact, signifying "shell turtle." A very interesting account of the turtle fishery of Celebes, contained in the 16th volume of the Transactions of the Batavian Society of Arts and sciences, describes the animal as follows. "The first named" (the kulitan) is the kind which, on account of its costly shell, is the most prized. It is the so named *caret* tortoise. The shell or [illegible] of this creature is covered with thirteen shields or blades, which lie regularly on each other in the manner of scales, five in the centre of the back and four on each side. These are the plates which furnish such costly tortoise shell to the arts. The edges of the scales of the back are further covered with twenty-five thin pieces joined one to another, which, in commerce, are known under the appellation of 'feet' or 'noses' of the tortoise. The value of the tortoise shell depends on the weight of each 'head,' by which expression is understood the collective shell belonging to one and the same animal. Such is the article of commerce so much in request, both for the Chinese and European markets. Shells, which have white and dark spots that touch each other, and are, as much as possible, similar on both sides of the blade, are in the eyes of the Chinese, much finer, and, on that account, more greedily brought by them than those which want this peculiarity. On the contrary, shells which are reddish rather than black in their dark spots, which possess little white which are more damasked than spotted; in a word, of which the colours, according to Chinese taste, are badly distributed, are less valued. The caprice of the Chinese makes them sometimes value single heads' at unheard-of prices, such for example, as go under the name of 'white heads,' for the varieties of which they have peculiar names. It is impossible to give an accurate description of these varieties, and their subdivisions, for these depend on many circumstances unappreciable to our senses. It is enough for me to observe that such heads as possess the above named qualities, that is, are very white in their blades, and have the outer rim of each blade, to the depth of two or three fingers, wholly white, and the weight of which amounts to two and a half catties, qualities that are rarely found united, may be valued at 1000 Guilders or even more (above 24£ per pound, avoirdupois). The 'feet' or 'noses' of the tortoise-shell are in demand only in the Chinese market. Whenever the two hinder pieces of these have the weight of a quarter of a catty (between 5 and 6 ounces), which is seldom the case, they may reach the value of fifty guilders, or more. The whole shell of a tortoise seldom weighs more than three catties (four pounds), notwithstanding, it is asserted that there occur 'heads' of four and five catties. Tortoise-shells are sometimes found of which the shell, instead of thirteen blades, consists of a single undivided one. The Bajos call this, which is rarely met with, loyong (brass?) The usual modes by which these people catch the tortoise are the adang (intercepting), the harpoon, and the net. To these we add the simplest of all, namely, falling on the females when they resort to the strand to lay their eggs. This is also the most usual, I may say almost the only way by which the inhabitants of the coast catch this animal. They need nothing

more than, as soon as they have got the creature n their power, to turn it on its back, when nable to recover itself it lies helpless. It ometimes, also, falls into the hands of the wellers on the coast, through means of their shing stakes, into which it enters like the ish, and from which it can find no outlet, but re- nains imprisoned in the innermost cham- er. When the Bajos have caught a tortise, hey kill it immediately by a few blows on the ead. They then take its upper shield, or the ack itself off, being the only thing about the nimal that has value. But as the shells adhere ast to each other there would be danger of tear- ng them, if they at once pulled the plates sunder, they usually wait three days, in which ime, the soft parts become decomposed, and he plates are loosened with very little trouble. he Indian islands furnish, I believe, the largest upply of tortoise-shell for the European and Chinese market, the chief emporia being Singa- ore, Manilla, and Batavia, from which are xported yearly about 26,000 pounds; and one alf of this quantity is from Singapore.—*Craw- urd Dict. page* 439.

Mr. Morrison tells us that, Tortoise-shell is he crustaceous covering of the *Testudo imbri- ata*, a native of the shores of most of the Indian slands; and that the best comes from the Spice slands and New Guinea, but it is collected all over he Archipelago and West Pacific. The common ame is hawk's bill tortoise. The shell is thicker, learer, and more variegated than that of any ther species, and constitutes the sole value of he animal. It is heart-form, and consists of hirteen inner with twenty-five marginal divi- ions. The middle side-pieces are the thickest, rgest and most valuable; the best is in large lates, free from cracks or carbuncles, and almost ransparent. The small, broken and crooked ieces are worthless. The Chinese use large uantities in the manufacture of combs, boxes, oys, &c. During the Company's monopoly, tor- oise-shell was brought to the Chinese market for xportation to England, but it is now carried to ingapore, and very little is brought to Hong-kong he price varies from $ 1000 down to 200 per ecul, according to quality.—*Morrison.*

The Madras Exports of Tortoise Shell was lbs. 08, value Rs. 2,204, in 1854. At the Madras xhibition the epidermoid plates which overlap ne back shell of the Marine Turtles (Chelone) ere transmitted from Travancore, apparently ne plates. Another epidermal production, called ortoise shell, from Madura and other inland ocalities was exhibited, but the specimens were f little value.—*M. E. J. B.*

(8241) TOUR: CAJANUS INDICUS.

Togari, CAN.	Tovare, TA.
Tuvar, HIN.	Kandula. TE.
Turi, MAH.	

(8242) TOUR; BURRIE TOUR—CAJANUS INDICUS, CYTISUS CAJAN. PIGEON PEA.—Large Dhal.

Toor dhal, HIND. | Thovary purpoo, TAM.

This is sown in fields at the commencement of the rains in June and sometimes much later; it is ripe in December. The seeds are sometimes ground into flour or split like dry peas: for the latter they are an excellent substitute. There are several varieties, which sell from 30 to 40 seers for the rupee. Is partly sown along with Ragi like Bullur, and partly in full in dry lands. The quantity of it grown in Mysore is not sufficient for the wants of the people, and it is consequently largely imported into that district from Baramahal and Bellary.

(8243) TOURMALINE (*Schorl*), a mineral occurring crystallised. Primary form a rhomboid; secondary forms, prisms with from 3 to 12 sides, terminated by very irregular summits. Cleavage parallel to the faces of the primary form. Fracture uneven, conchoidal. Hardness: scratches glass easily. Electricity: according to Hauy the transparent varieties when heated become electric; the termination of the prism which presents the greater number of faces becoming positive, while the other end becomes negative. Colour white, brown, blue, yellow, green, red, and black. The blue variety is called *Indicolite* and the red *Rubellite*. *Schorl* is a name formerly given to black tourmaline, Lustre vitreous. Transparent, translucent, opaque. Specific gravity 3.069 to 3.076. Before the blow-pipe all the varieties fuse readily with borax, producing at first slight effervescence.

Tourmaline occurs most commonly in primary rocks, especially in granite, gneiss, and mica slate. The red variety, or rubellite, is found in Siberia; the blue, or indicolite, at Uto; the green in Brazil; the black in Devonshire and many other places. The composition of tourmaline is extremely various. That of the red appears, from the analysis of Vauquelin, to be the simplest, consisting of

Silica	42
Alumina	40
Soda	10
Oxide of Manganese	7
	99

Some varieties contain also potash, lithia, lime, magnesia, oxide of iron, and boracic acid. The proportions of these constituents are extremely variable, and no one variety contains all the enumerated substances. The black tourmaline from Devonshire yields nearly 19 per cent. of oxide of iron, and that of Eibenstock nearly 24 per cent. of the same oxide.

The word Tourmaline is a corruption of the name in Ceylon, whence it was first brought to Europe. *Lyncurium* is supposed to be the ancient name for common tourmaline; and the red variety was probably called *Hyacinth*.

The red tourmalines, when transparent and free

from cracks, are of great value, and afford gems of remarkable beauty. They have all the richness of colour and lustre belonging to the ruby, though measuring an inch across. A Siberian specimen of this variety, now in the British Museum, is valued at 500*l*. The yellow tourmaline from Ceylon is but little inferior to the real Topaz and is often sold for that gem. The green specimens, when clear and fine are also valuable for gems.

Tourmaline on account of its property of polarising light, is used largely in the manufactures of polarising instruments. (Dana, Manual of Mineralogy.)—*Eng. Cyc. p.* 1084

(8244) *Yellow tourmaline.*—Among the Ceylon diamonds that are seen for sale in Maulmain, is a yellow jewel resembling a topaz; but which Mr. Mason finds on examination to be yellow tourmaline.

(8245) *White tourmaline.*—An occasional crystal of white tourmaline is seen among the crystals of the black variety in specimens from the Shan states; but he has never met with it in the Provinces.

(8246) *Red tourmaline.*—Red tourmaline is found in Burmah, though it is not seen at Moulmein Jameson says the king of Ava gave a specimen to Symes which was valued at five hundred pounds in England.—*Mason.*

(8247) *Schorl*, or black tourmaline, is found in Madura, in great abundance, also in quartz near the mouth of Tavoy river on the east side and also at the foot of the eastern mountains, near the head waters of the Dahgyaine, north east of Maulmain. These are the only localities where Mason met with this mineral. In both, the crystals are numerous, and in Tavoy they are large, but not so handsome as seen in foreign specimens.—*Mason.*

(8248) *Green Tourmaline.*—A green jewel that cannot be distinguished by the eye from beryl, is brought with the Ceylon diamonds; it is however, green tourmaline; as may be ascertained by a very simple test, for beryl scratches quartz, but tourmaline is scratched by quartz.—*Mason.*

(8249) *Ceylon Diamonds.*—White jewels of an inferior quality are often offered for sale in Maulmain under the name of Ceylon diamonds, but they are usually made from green tourmaline. White tourmaline, is a rare mineral, but the green variety being common, the jewelers by exposing it to heat expel its color and it becomes white.—*Mason.*

(8250) TOURNEFORTIA, a genus of Plants belonging to the natural order Boraginaceæ, so named by Linnæus in honour of Joseph Tillon de Tournefort. It is characterised by having a salver shaped or rotate corolla, of which the throat is naked; the stamens included within the tube of the corolla; the stigma is peltate, and the fruit consists of a berry which contain 4 1-seeded nuts. The species are about 50 in number, forming small shrubs or herbs, diffused through the hot parts of the world. as the West Indies, South America, Indian islands, and India.—*Eng. Cyc. p.* 1084.

(8251) TOWELS of different sizes are chiefly made in the districts of Cuddalore, Chinglepu and in the outskirts of Madras and of a quality equal to those of English manufactures. At the Madras Exhibition of 1855, there was awarded to Chengalroya Chetty, for the best Towels from Cuddalore, a prize of Rupees 50.

(8252) TOYS.

Speelgoed, Dut.	Rumakra, Guz.
Jouets, Bimbelots, Fr.	Trastulli It.
Spielzeug, Spielsachen, Ger.	Shai-i-bazee, Pers.
Khail, also Killownee Hind.	Igrushki, Rus.
	Dijes, Juguetes de mimos, Sp.

Are playthings, baubles, and trifling ornaments of all sorts, made expressly for the amusement of children.—*Faulkner*

(8253) TRADESCANTIA, a genus of Plants belonging to the natural order *Commelinaceæ*, which was so named in honour of the English botanist John Tradescant, who was gardener to Charles 1. The species are natives of America and of India. Many of them, being of a highly ornamental nature, are cultivated in flower-gardens; a few are used medicinally in the countries where they are indigenous. Thus *T. axillaris*, according to Rheede, is used in India as an application to the abdomen in cases of tympanites; and Martius describes the stem and leaves of *T. diuretica* as being employed in Brazil as emollient applications in rheumatic pains, intestinal derangements, and in retention of urine; while in North America *T. Virginica* is employed in cases of bites of venomous spiders, as well as some other species, whence it has obtained the name of Spider-Wort, but it is doubtful whether they possess any other than simple emollient properties. The hairs of the stamens of this plant exhibit a circulation, in the cells of which they are composed.—*Eng. Cyc.*

(8254) TRAGACANTH, Gum Dragon.

Samagul-kateera, kaseera, Katira, Arab.	Kattera, Guz. Hind.
Gommi astraganti, Fr.	Tragacantha, Lat.
Traganth, Ger.	Vadomocottay pisin, Tam.

A gum produced, according to some authors, by a species of *Astragalus*, growing in Persia and Turkey. It is more costly, and extremely different in many of its properties from Gum Arabic. The finest kind occurs in twisted, vermicular, rounded or elongated pieces, almost transparent, whitish, brittle, inodorous, with slightly bitter taste. It is also found in large tears of a vermicular form, a reddish color, and mixed with impurities. It is

used in topical dyeing, and in pharmacy for making powders into troches, &c. (*Waterston*). —*Faulkner*. The source of this product however, seems to be several plants, according to the different colleges it is the Gummy exudation of Astragalus gummifer, *Lab.* and other species, E., A., verus, *Olivier*, L. and E., A. creticus, *Lamarck*, D. The τραγάχανδα of Dioscorides was no doubt a plant of the same genus as that which now yields Tragacanth. Sibthorp considers *Astragalus aristatus*, L'Hert, to be the plant. Arab authors describe it by the name *kusera* or *kutira*, for which, in India, *kuteera* is substituted. A substance known by this name is produced both in the North-west and in the Peninsula of India by *Cochlospermum Gossypium* and in Pegu according to McClelland by several species of Sterculia. Tournefort adduced *A creticus* of Lamarck, a native of Mount Ida in Crete, to be the plant yielding Tragacanth. Labilladiere describes *A. gummifer* a native of Mount Libanus in Syria, as one of the plants; while Olivier states his *A. verus*, inhabiting Asia Minor, Armenia, and northern Persia, as yielding the largest quantity of Tragacanth. Dr. E. Dickson, Physician to the consulate at Tripoli, when travelling in Koordistan, collected specimens of the plants which he ascertained to yield Tragacanth. These he gave to Mr. Grant, British Consul at Erzeroum, by whom they were sent to Dr. Lindley, who determined that the white or best variety of Gum Tragacanth is yielded by *Astragalus gummifer*, and the red or inferior kind by his *A. strobiliferus*. Dr. Dickson, when in England, favoured Dr. Royle with the following observations: " Besides the two last-named species, I observed also a third variety that gave gum Tragacanth, which unfortunately I lost when my things were robbed at Hassan-kaleh. From the Koordish mountains being covered with many species of Astragalus, I should think it not unlikely that other varieties of this genus may hereafter be discovered yielding the gum."

(8255) *Astragalus Dec. Diadelph. Decand.* Linn. Calyx 5-toothed. Corolla with an obtuse keel. Stamens diadelphous. Legume 2-celled, or half 2-celled in consequence of the dorsal or lower suture being turned inward, *Dec.*

Sectio Tragacanthæ.—Petioles permanent, thornlike. Stipules adhering to the petioles.

(8256) *Astragalus Verus. Oliv.* L. E. Flowers yellow, axillary, in clusters of 2 to 5, sessile. Calyx tomentose, obtusely 5-toothed. Leaflets 8 to 9 pairs, linear, hispid. A native of Anatolia, Armenia and Northern Persia, yields Tragacanth, which is collected from July to September. Used in Persia, exported to Europe and also to India.—Oliv. Voy. 3, t. 44; Nees von E. 329.

(8257) *Astragalus Gummifer. Labill.* E — Flowers 3 to 5 axillary, sessile. Calyx 5-cleft, together with the legumes woolly. Leaflets 4 to 6 pairs, oblong, linear, smooth. A native of Mount Lebanon, also, of Koordistan, where it yields white Tragacanth, but which Labilladiere represents as vermicular in form.

(8258) *Astragalus Creticus. Lam.*—Flowers axillary, sessile, aggregate. Calyx 5-partite, with feathery setaceous lobes rather larger than the corolla. Leaflets 5 to 8 pairs, oblong, acute, tomentose. Mount Ida in Crete, where it yields a little Tragacanth.

(8259) *Astragalus Aristatus. L'her.*—Peduncles very short, usually 6-flowered; calycine teeth long and setaceous; leaves with 6—9 pairs of oblong, linear, mucronate, pilose leaflets; legumes scarcely half bilocular. A native of the Alps of Europe, also of Greece. Sibthorp states that this species yields a gum called τραγοχανδα in Greece, which was exported to Italy. Landerer has lately ascertained that Tragacanth was yielded by this species on the hills near Patrass, and exported to Venice and Trieste, or as Levant Tragacanth to Marsellies and Ancona: (c)

(8260) *Astragalus Dicksonii. Royle.* (*A. strobiliferus, Lindley*, not of Royle, Him. Bot. p. 199)—Flowers capitate in an ovate, sessile, axillary strobile. Bracts imbricate, pinnated, tomentose. Calyx feathery, 5-cleft. Segments of the corolla equal. Leaflets 3-paired, woolly, oval, awned at the apex, narrow at the base, *Lindley*. As Dr. L. has inadvertently named this species *A strobiliferus*, there being already one of that name, Dr. Royle named it after the discoverer of the plant, who also found that it yielded a reddish coloured Tragacanth. Tragacanth exudes from the above plants either naturally or from wounds, and hardens in various forms. It is imported into England from Smyrna, the Levant, and also from Greece. It is found in commerce either of a white or a reddish-yellow colour, in broad thin flakes, or in tortuous vermicular pieces; the former is the best, and most common there. It is white or greyish, semitransparent, tough, horn-like, and tasteless, and being a little elastic, is with difficulty reduced to powder, unless heated to 110°. In contact with cold water, it absorbs a certain portion, swells, becomes adhesive and diffused. It does not dissolve except in boiling water, when some change is supposed to take place, a great portion, however, separating again. It is insoluble in Alcohol. Tragacanth appears to consist of two distinct gummy principles. Bucholz and Guerin Varry found of common Gum or Arabin from 53 to 57 per cent., and of Bassorin 33 to 43 parts, with water and a little starch, the presence of the latter producing a blue colour with Iodine. The *Arabin* rather resembles than is identical with Gum Arabic, for, as first pointed out by Dr. Duncan, its mucilage is not precipitated by Silicate of Potash. The *Bassorin* is like that found in Gum Bussorah, and other imperfectly soluble

gums. It is sometimes called *Tragacanthine*, is solid, colourless, without odour or taste, insoluble in water, but absorbing it and swelling up. Nitric acid converts it into Oxalic and into Mucic acid. Sulpluric acid changes it to a saccharine substance, which is not susceptible of Alcoholic fermentation. Guibourt, however, considers Tragacanth to consist of a peculiar Mucilaginous principle, with a little Starch and Ligneous fibre.—*Royle.*

(8261) TRAGIA, a genus of Plants belonging to the natural order *Euphorbiaceæ*, named after Tragus, a German botanist, whose real name was Bock. The species are found in India and in America, are climbing in habit, and some are remarkable for stinging as violently as nettles. *T. cannabina* is so named from its leaves resembling those of the *Cannabis*, or Hemp, and of which the roots given in infusion are considered diaphoretic and alterative. *T. involucrata* is a small plant without taste or smell, but the native physicians of India consider it calculated to strengthen the system in cachectic states of the constitution and in chronic cases of syphilis. *T. volubilis*, which is a stinging climber, and has a very acrid juice, is employed in conjunction with common salt for the destruction of some kinds of ulcers.—*Eng. Cyc.*

(8262) TRAGIA CANNABINA, Lin. ROOT OF THE HEMP LEAVED TRAGIA.

SirrooCanchorie vayr, TAM.	Tsinna Doolagendie vayree, TEL.
Kanchkoori ke jurr, DUK.	Casaghinnie, SANS.

This root sometimes called in Tamul "*Coorundootie vayr*," has in its dried state but little taste or smell, though in its more succulent condition, it is said to have an agreeable odour. It is considered as diaphoretic and alterative, and is prescribed in decoction together with other articles of the same class to correct the habit. An infusion of it is also given as a drug in ardent Fever.—*Ains. Mat. Med. p.* 114.

(8263) TRAGIA INVOLUCRATA. Roxb. iii. p. 576.

Bichittee, BENG	Canchorie Root. ENG.
Canchorie vayr, TAM.	Doostparisha, SANS.
Doolaghondi vayroo, TEL.	

Hairs sting violently; roots given by the Vaidas as alterative in cachexia and venereal diseases. (*Ainslie.*)—*O'Shaughnessy, page* 562. This small root has in its dry state no sensible taste or smell; the Vyteans however reckon it amongst those medicine which they conceive to possess virtues in altering and correcting the habit in cases of Mayghum, (Cachexia) and in old venereal affections attended with anomalous symptoms, and Rheede, in speaking of the same root, has these words "Conducit in febre ossium, ac servit pro pruritu corporis." He further adds in decocto data, urinam suppressam movet.—*Ains. Mat. Med. p.* 75.

(8264) TRAGOPOGON (from τράγος, a 'goat,' and πώγων, beard), a genus of Plants belonging to the natural order *Cichoraceæ*, which is usually considered only a tribe of the great order of *Compositæ*. The genus *Tragopogon*, or Goats Beard, is so named from the long silky beard or pappus of the seeds. The genus is distinguished by having a simple involucre of many leaves. Receptacle naked. Pappus stalked, plumose. Achenia longitudinally striated. The species are found in the temperate parts of Europe and of Asia. One, *T. gracilis*, is found in the Himalaya Mountains, of which the leaves are eaten by the natives as lettuce is in Europe, but without being blanched. The best-known species however is *T. porrifolius*, or Salsify, which is occasionally cultivated in England but frequently in France and Germany. The English *T. pratensis* may be cultivated for the same purpose. The roots of Salisty are the parts esteemed: they are long and tapering, their flavour mild and sweetish, and are boiled or stewed like carrots. The stalks of year-old plants are sometimes cut in the spring, and when similarly dressed, taste like asparagus.—*Eng Cyc.*

(8265) TRAGOPOGON PORRIFOLIUS, SALSAFY. An excellent vegetable cultivated for its white roots which are mild and sweet flavoured, requires culture similar to carrots, held in high estimation by the French. The young shoots are sometimes used as asparagus, which in flavour they resemble. A native of England. Raised from seed—*Jaffrey.*

(8266) TRAP. This geological term, one of most general use and comprehensive signification, seems to have been originally employed by Bergman and the German and Swedish miners, in the sense of the word 'trappa,' Swedish, or 'treppe,' German, meaning stairs, and the aspect of the rocks now called Trap, in successive terraces on hill sides, is such as often to justify the use of the word. In modern works on topographical geology a very great proportion of the ancient rocks of fusion are familiarly called Trap, not because they have any certain mineral composition, but because, whether granitic, sienitic, prophyritic, or hornblendic, they appear under particular relations of position or geological age. In this sense the term is purely geological, and we have as distinctive designations Eruptive Trap, Contemporaneous Trap, Overlying Trap, Interposed Trap, &c. By other writers the term is restricted so as to leave out such massive and generally deep-seated rocks as granite, or even contracted to the hornblendic and felspatho-hornblendic rocks, which appear as dykes, interposed beds, and overlying masses. It thus appears to be a collective term more convenient than precise. In a geological sense it may be replaced by descriptive words, such as Irruptive,

nterposed, Overlying, &c, and in a mineralogical sense it is advantageously changed for Basalt, Greenstone, Felsparite, Sienite, Serpentine, Diallage Rock, &c.—*Eng. Cyc.*

The greatest outburst of Trap in the world, s perhaps that described by Colonel Sykes, as he Trap formation of the Dekhan, the Editor as (*Barometrical Sections of India* page 4) remarked thus:

Volcanic trap is visible, however, in the bed of the Jumna, near Allahabad, in latitude 25° north, and in the ascent to Mussoorie, by Kuerkoolee, the granite re-appears and it makes a great eruption at the Chur Mountain, above 12,000 feet high, on the southern slopes of the Himalayas. But near Gungotri, at the source of the Ganges, is described to be the grand granitic axis of the Himalayas, and one of the greatest and most magnificent out-bursts of granite in the world. It traverses these mountains in numerous veins—westwards towards the Barenda pass, and eastwards towards Kamet, Nandadevi and Nandakot, upraising the metamorphic schists which form the highest peaks of the snowy range. Lower down, on the southern slopes of those mountains, from 8,000 to 1,500 feet in height, uplifted stratified rocks rest on the gneiss and granite, consisting of hornblende rock and slate, limestone, sandstone, great beds of quartz, clay, mica, chlorite, and talc slates, and lower still, at latitudes of 3,000 to 2,500 feet above the level of the sea, gravel, boulders, marl with coal, recent clays and sandstones from the Sewalik or Sub-Himalayan Mountains. It is in these hills that the extensive fossil remains were discovered, and the low alluvial tract, known as the Terai, is the valley formed by the junction of the Sewalik with the Himalayan inclined rocks. To the south of this the highest parts of Central India occur along the Arravalli Mountains and the Vindhya range and are from 2,000 to 3,000 feet in altitude. There are, here, three inclinations, the one declivity sinking from the Arravalli Mountains towards the valley of the Indus, another falls from the Vindhya range northwards to the Ganges, and the third is southwards to the Nerbudda. Granite is here, also, the upraising rock, it bursts out at Oudeypore, Kaunmore, Banswarrah, and Rajpoor, through the gneiss, and mica, and chlorite slates, limestone and sandstone. It was to the east of this central tract that the first great deposit of coal was found lining both banks of the Damoodah, though it has, since then, been discovered in numerous other provinces of our eastern empire. It is in Central India, also, that the volcanic rocks to any extent, are first observed as they spread east and west from Neemuch in the form of basalt, basaltic greenstone, greenstone and greenstone amygdaloid, and southwards by Oujein and Saugor across the Vindhya, assuming the structure of columnar basalt in their steep descent to the Nerbudda. The trap crosses this river and spreads over all the Aurungabad province down through Candeish and the Concan to Bombay, and southwards to Malwan in latitude 60° north, its southern limits being observed south of Punderpoor, through Bejapoor to the right bank of the Kistnah, in the valleys near Hoonnabad, where it is found between and beneath but never penetrating the laterite hills south and east of Beder and at Maharajahpettah, thirty miles west of Hyderabad. The eastern edge of this vast tract of trap rocks, after crossing the Nerbudda to the south, skirts the town of Nagpore in Berar, passes Nandier and to the westward of the city of Hyderabad to its southern limit, just mentioned. South of this as well as to the eastward, the trap only appears as great dikes, from fifty to a hundred yards broad, which run east and west parallel with each other. These dikes can often be traced for a hundred and fifty miles together, bursting through the granite and other rocks, tearing the highest of the hills asunder and filling the chasms and crevices with its dark and compact structure. In these dikes the elements of the trap rock assume a variety of appearances, greenstone, porphyritic greenstone, basaltic greenstone, hornblende rock, and basalt; they are particularly numerous in Hyderabad, the Balaghaut Ceded Districts, the Carnatic and Mysore almost to the southern Cape of the Peninsula, and, with very rare exceptions, run due east and west.—*Barometrical Sections of India.*

(8267) TRAPA, a genus of Plants belonging to the natural order *Onagraceæ*. The fruit of *Trapa* is furnished with spines, and the species are commonly called Water-Caltrops, from the plants floating on the surface of lakes, and on that of slow-running waters. They are found in the temperate parts of Europe and of Siberia, in Cashmere, India, Cochin China, and China. The genus is characterised by having a 4-parted adherent calyx; petals and stamens 4; ovary 2-celled, with solitary pendulous ovules. The fruit is hard, indehiscent, 1-celled and one seeded. The seed is large and exalbuminous; the two cotyledons very unequal. The floating habit and clustered leaves easily distinguish these plants. The leaves under water are cut into capillary segments, and the petioles are tumid in the middle.—*Eng. Cyc.* The fruit of *Trapa natans* and *T. bispinosa*, is called *singara*; these are sold in all the bazars, and form a considerable part of the food of the inhabitants of Cashmere, where it yields the Government 12,000*l.* of annual revenue. Mr. Moorcroft mentions that Runjeet Sing derived nearly the same share. From 96,000 to 128,000 loads of this nut are yielded annually by the lake of Ooller alone. The nut abounds in fecula, and is armed with two singular projecting spines. In China the kernel is used as an article of food, being roasted or boiled like

the potatoe. (*Royle*, p. 211.)—*O'Shaughnessy, page* 331.

(8268) TRAPA BICORNIS is distinguished from T. bispinosa by its two horns being recurved and very obtuse. It is carefully cultivated in lakes, ponds, and other receptacles of water.

(8269) TRAPA BISPINOSA. TWO-SPINED WATER CALTROPS.

Singhara, HIND.

Much cultivated in tanks during the rains. The seed is much eaten boiled or roasted.—*Genl. Med. Top. p.* 180. *T. bispinosa*, Roxb. ('Corom. Pl.,' ii. 234), has the nut with two opposite, straight, barbed, spinous horns, noticed by Sir W. Jones under the Sanscrit name of Sringata: it is commonly known all over India by the name Singara, both names having reference to its horned appearance. It is also found in the Lake of Cashmere. In India the nuts are sold in all the bazars, as their farinaceous kernels are much esteemed by the Hindoos. A species called by the same name, Singhara, forms a considerable portion of the food of the inhabitants of Cashmere.—*Eng. Cyc.* The Singhara is a water plant, and is cultivated in many of the tanks. There are two kinds,—one with a hard thick shell, and the other with only a soft skin. The former, when ripe, has the appearance of a bullock's head, from two sharp spear-like processes growing from it. The fruit when boiled resembles a chesnut, and is sold in the bazar. The seed is also made into a coarse flour, and cakes are made from it; both fish and tortoise feed upon the thin-shelled kind. In some parts of the country, great care is taken to preserve the seed for planting the following season, which is done by treading it into the beds of tanks and such places. The fruit is fit to be taken at or about the close of the rains.—*Jaffrey.*

(8270) TRAPA NATANS, the European species, is remarkable for its fruit with 4 spines, being of a blackish colour and large size, and its seed, which nearly fills it, being farinaceous, and good to eat, whether raw, roasted, or in soups, and is somewhat like a chestnut in taste. It was known to the Romans by the name Tribulus. Pliny says (lib. xxi., c. 58), "About the rivers Nilus and Strymon the inhabitants gather it for their meat"—*Eng. Cyc.* In China where the water is very shallow, a great part of it is covered with the *Trapa bicornis*, a plant called "*ling*" by the Chinese. It produces a fruit of a very peculiar shape, resembling the head and horns of a bullock, and is highly esteemed in all parts of the empire. Fortune saw three distinct species or varieties, one of which has fruit of a beautiful red colour.—*Fortune, page* 27.

(8271) TRAP TREE, a species of *Artocarpus*, which furnishes the Gutta used as birdlime. The fibre of the bark is used for fishing lines, cordage, and nets at Singapore.—*Royle.*

(8272) TRAVANCORE. At the Madr Exhibition of 1855, the most valuable of tl drug collections in regard to extent, variety ar careful method in which they had been put u was forwarded by E. Waring, Esq., Res dency Surgeon, Travancore. It consisted of 24 specimens, accompanied with a descriptive cat logue of the drugs, and well dried specimens c the plants—the numbers being attached, corres ponding with the vegetable products. This col lection contained *Star Aniseed*, some remarkabl *Galls*, *Wood Aloes*, *Butea Kino*, *True Kinc Mutty Pal*, &c., also the root of a *Smilax* which is reported to be a good substitute for Ja maica sarsaparilla, *Cocculus Indicus*, *Nux Vomica Zedoaria*, &c. *Croton Tiglium*, *Aristolochia Indica Curcuma Montana*. The series was admirably arranged, was a source of much attraction during the Exhibition, and the Jury awarded Mr. Waring a 1st Class Medal.—*M. E. J. R.*

(8273) TRIANTHEMA, a genus of Plants of the natural order *Portulaceæ*, so named from τρεῖς, three, and ἄνθος, a flower, in consequence of the flowers growing in threes, in the axils of the leaves. The species occur as weeds in every part of the plains of India. *T. obcordata*, like the plants of the family, to which it belongs, is employed by the natives of India as a pot-herb; but the nauseous and bitter roots of *T. monogyna* are said by Dr. Ainslie to be employed as a purgative by the inhabitants of Hindustan.—*Eng. Cyc.* Dr. Wight gives Trianthema decandra 296; obcordata 288.

(8274) TRIANTHEMA DECANDRA.

Beeskhopra, DUK. | Sweet punarnavi, SANS.

Root size of small finger, light brown out side, white within, aperient. "Four pagodas weight of bark of the root made into a decoction with 1 lb. water and boiled down to ½ a lb. will open the bowels." (*Ainslie.*)—*O'Sh. p.* 353.

(8275) TRIANTHEMA OBCORDATA, Roxb. formerly his *T. Monogynia*. Ainslie, vol. ii, p. 370.

Nusurjinghi ke jur, HIND. | Sharvalay Kceray, TAM.
Punarnavi. SANS.

The root is found in bazars; colour pale; much wrinkled, bitterish, and rather nauseous to the taste, considered cathartic, and given in powder to the extent of two tea-spoonful twice daily with a little ginger.—*O'Shaughnessy, page* 353. A troublesome weed, springs up every where; the young leaves used as spinach, when somewhat old mixed with others and used as greens. —*Jaffrey.*

(8276) TRIAS OBLONGA. Many of the mango trees have a species of trias growing on them, the smallest plant of the orchid tribe that is seen in the Tenasserim Provinces.—*Mason.*

(8277) TRIBULUS (τρίβολος, three spiked or pointed), a genus of Plants belonging to the

natural order *Rutaceæ*, the fruit of which is armed with prickles. It has a 5-parted calyx ; petals 5, spreading ; stamens 10 ; ovary superior ; capsules 5, gibbous, spiny, many-seeded. The species are found in the south of Europe and the subtropical and tropical parts of the world, with diffuse, often procumbent stems, with solitary white or yellow flowers in the axil of the leaves. *T. terrestris* is sometimes cultivated in the gardens of the West Indies on account of the sweet scent of its flowers. This, as well as *T. cistoides*, has some aperient properties ascribed, and is therefore sometimes used medicinally in the countries where it is indigenous. [TRAPA.]—*Eng. Cyc.*

(8278) TRIBULUS AQUATICUS vegetates at Lahore and Cashmere, and affords a considerable revenue, principally to the Cashmerean government The waternuts are boiled, and so sold, in bazars. A poultice of Trapa natans is recommended to resolve indolent tumors probably Trapa bispinosa would serve the same ends. *Thirty-five years in the East by Dr. Honig. p.* 359.

(8279) TRIBULUS LANUGIONOSUS.—WOOLLY CALTROPS.

Gokooroo, Gokru, HIND.

Very universal over the ground in Rajwarra. The seeds and capsules are highly mucilaginous. —*Gen. Med. Top. p.* 193. It is a common annual flower with yellow flowers and angular thorny fruit.—*Riddell.*

(8280) TRIBULUS TERRESTRIS. SMALL CALTROPS Lin.

Niringie, also Nerringee-keeray, TAM.	Gokoroo, DUK.
Pulléroo, TEL.	Khussukee sagheer, ARAB.
	Soodumstra, SANS.

A procumbent annual weed with thorny capsules, yellow flowers, leaflets are eaten mixed along with others ; seldom used but in time of scarcity.—*Jaffrey. Tribulus terrestris*, is used in Cochin China as an astringent, in the South of Europe as an aperient and diuretic.—*Eng. Cyc.*

(8281) TRICHILIA, a genus of Plants belonging to the natural order *Meliaceæ*. The species are found in the tropical parts of America, and a few in Africa and in Australia. Indian species, *T. spinosa*, is not well known, but the oil of its seeds is said to be a useful remedy in chronic rheumatism and paralytic affections. Several are possessed of active properties. Forskal found the fruit of one species in the mountains of Yemen used as an emetic, and called Jouz-al-Cai, or the Emetic Nut, whence he named it Elcagi, now called *T. emetica*. The seeds bruised are used for washing the hair, as well as an application in itch. *T. trifoliata*, a native of Curacoa, has an unpleasant smell in all parts, and is said to possess active properties. *T. cathartica* is described by Martius as having great bitterness, and as employed in Brazil as a cure for fevers, &c. *T. moschata* is remarkable in Jamaica for the odour of musk which it diffuses all around, on which account it is called Musk-Wood.

(8282) TRICHILIA EMETICA. ELCAJA, is an Arabian Plant, whose fruit is said to possess emetic properties. Botanists call it *Trichilica Emetica*. Forskahl describes it as a large tree, with villous shoots, pinnated leaves, with entire ovalo-oblong pedicellate leaflets, clustered flowers with 5 greenish-yellow petals, 10 monadelphous stamens, and a downy capsular fruit about an inch long, with 3 valves, 3 angles, and 3 cells, having 2 plano convex seeds in each cell. The tree is said to be called Roka, and to be common on the mountains of Yemen. The fruit is sold at Bei el fakih, for mixing with fragrant materials with which the Arab women wash their hair. The fruit called 'Djous el kai' is reputed an emetic. The ripe seeds mixed with Sesamum oil are formed into an ointment as a cure for the itch.—*Eng. Cyc* Common on the mountains of Yemen and in Senegal. The fruit is used by the Arabs under the name *Djous el kai*, and in powder mixed with oil is employed against the itch.—*O'Shaughnessy, page* 245.

(8283) TRICHILIA SPINOSA. Willd. THORNY TRICHILIA,

Caat Koorundoo, TAM.

From the berry of this thorny plant is prepared a warm oil, which the Native Practitioners consider as a valuable application in chronic rheumatism and paralytic affections.—*Ains. Mat. Med. page* 74.

(8284) TRICHODESMA. Royle states that the species of Trichodesma are deemed diuretic, and are supposed cures for snake bites.—*O'Shaughnessy, page* 467.

(8285) TRICHOSANTHES, a genus of plants belonging to the natural order Cucurbitaceæ. Many of the species are edible, and from the long often sinuous-formed fruit they have been named Snake-Gourds ; the Anguina of some botanists. The fruit of many of the species is eaten in India whilst that of others contains a purgative principle.—*Eng. Cyc. page* 1092.

(8286) TRICHOSANTHES AMARA, St. Domingo, seeds bitter and astringent, sometimes emetic.—*O'Sh. p.* 209.

(8287) TRICHOSANTHES ANGUINA, SNAKE GOURD.

Chichinga, Chichuda HIND.	Petala Ular, MALAY.
Pondalungai, TAM.	Purwar, HINDOOS.
Chichonda, DUDK.	Pottola, SANS.
Pottlakaia, TEL.	

This is the produce of a plant of the class Monœcia and order Syngenesia : in shape resembles a long snake and is made into curries and other dishes.—*Ainslie, p.* 243. The Snake Gourd is cultivated by the Natives grown

from a very remote period, been regarded with superstitious reverence.

"The holy trefoils charm"

was supposed to be very "noisome to witches," and to keep those who wore it from the influences of evil spirits of all kinds.. *Trifolium Suffocatum, Trifolium Glomeratum, Trifolium Subterraneum, Trifolium frugiferum*, all are British species.—*Eng. Cyc.*

(8306) TRIGLA, a genus of Acanthopterygious Fishes, popularly known as Gurnards, and belonging to the family *Loricati* in the arrangement of Cuvier. The head of *Trigla* is mailed and angular; the opercle and shoulder-bones armed with spines; the body is scaly; there are two distinct dorsal fins; beneath the pectorals are three detached rays the branchiostegous membrane has seven rays; both jaws and the front of the vomer are armed with fine velvety teeth. The Gurnards are fishes always remarkable for singularity of form, and often for brilliancy of colouring. They derive their popular appellation from a grunting noise which they make when taken out of the water. In the British seas the commonest species are the Gray Gurnard (*Trigla Gurnhardus*), a silvery gray fish more or less clouded with brown and speckled with black; the Red Gurnard (*Trigla Pini*), of a bright rose-red colour; and the Sapphirine Gurnard (*Trigla Hirundo*), a large and handsome fish remarkable for the vivid green and blue hues of the inner surface of its large pectoral fins. The two last are most abundant on the western coast. Several other rarer species are also inhabitants of the British seas. There are some beautiful small species in the Mediterranean where also lives the Flying-Gurnard (Dactylopterus volitans), which differs generically from Trigla in having the fine rays of the pectorals connected by membranes, by means of which the fish is enabled to support itself for some time in the air in the manner of the flying-fish. It is a handsome species, above a foot long. Another Flying-Gurnard (Dactylopterus orientalis) lives in the Indian ocean.—*Eng. Cyc.*

(8307) TRIGONELLA (from Τρεῖς, three and γωνία, an angle) a genus of Plants belonging to the natural order Leguminosæ. It consists of strong scented herbs with trifoliate leaves; the calyx is 5-parted and 5-toothed; the keel of the corolla is obtuse; the stamens are diadelphous; the style is smooth; the fruit a legume; unilocular, compressed, linear and containing six or more seeds. The known species of this genus are upwards of thirty. Only five of them are European, and only one is found in Great Britain.—*Eng. Cyc.*

(8308) TRIGONELLA CORNICULATA, is given by Dr. Wight, in Icones.

(8309) TRIGONELLA FÆNUM-GRÆCUM, The common Fenugreek, has the stem erect simple; the leaflets obovate, slightly toothed; the stipules lanceolate, falcate, entire, the calyx hairy, the teeth awl-shaped, of the length of the tube; the legume is falcate, many seeded; the seeds large, ovate, wrinkled from dots; radicle of cotyledons, prominent. This plant is a native of the south of Europe. Dr. Sibthorp found it in abundance on the shores of Asia Minor. This plant or one of the genus was known to the Greeks under the name, Τῆνοδαρον, and to the Romans as Fænum—Græcum, Greek *Hay and the seed was held in great esteem as a medicine.* The scent of the seeds is very strong and it was undoubtedly this circumstance that recommended them to notice as medicinal agents. —*Eng. Cyc.*

The seed.

Shemlit, Pers.	Helbh, Arab.
Metha and Moothe, Duk. Hind. Sans.	Methee-bhak, Beng.
	Vendee-kerray, Tam.

This plant is a native of the South of Europe and cultivated in Asia Minor and in India.

Mucilage, starch, fixed oil, and colouring matter, constitute the greater part of this seed; it is used by the native practitioners in dysenteric affections, and the Arabs employ it in poultices and fomentations. (*Ainslie.*)—*O'Shaughnessy, p.* 291. It is cultivated for a pot herb, considered very wholesome, imparts a very strong odour and taste to curries, the seeds are said to be slightly tonic.

(8310) TRIOSTEUM HIMALAYANUM. Has been discovered by Dr. Wallich's people at Gossainthan in Nepal.—*O'Shaughnessy, page* 377.

(8311) TRIOSTEUM PERFOLIATUM. United States; called 'fever root,' and 'wild ipecacuan.' "The bark of the root is emetic and purgative, leaves diaphoretic, their efficacy impaired by age; they should be preserved in closely stopped jars, and changed annually."—*Lindley Fl. Med. p.* 445.)

(8312) TRIPHASIA. A genus of Plants belonging to the natural order *Aurantiaceæ* of which the species are found in the East Indies, Cochin-China, and China. The calyx is 3-cleft; petals 3; stamens 6, rarely 5-8; filaments awl-shaped, flat; anthers cordate, oblong; fruit baccate, 1-3-celled; seeds 1 in each cell. The species form thorny shrubs with simple or trifoliate leaves. The fruit of *T. trifoliata* is acid in taste, something like the orange, and is both preserved and eaten as a fruit.—*Eng. Cyc.*

(8313) TRIPHASIA TRIFOLIATA, Three-Leaved Triphasia. The three-leaved triphasia which bears a small berry like [illegible]range in minature, often found in Chinese p[illegible]ves, is raised in European Gardens.—*Mason.*

(8314) TRIPOLI. A Mineral, occurring massive, with a coarse dull earthy fracture. It is meagre and rough to the touch, and yields readily to the nail. Colour, various shades of gray, yellow, and red. It imbibes water, which softens it; when burned it becomes white and is

hardened; it is very difficult of fusion. It was first brought from Tripoli in Africa, but has since been found in France, Italy, and Germany. It is employed in polishing metals, marble, glass, &c. It consists of silica, alumina, and oxide of iron.

(8315) TRIPTOLOMEA. A genus of Plants belonging to the natural order *Fabaceæ*, or *Leguminosæ*, and to the sub-order *Papilionaceæ*. The species are natives of warm climates, and yield the Rose-Wood of commerce.—*Eng. Cyc.*

(8316) *TRITICUM*, a genus of Plants yielding the various kinds of wheat, and belonging to the natural order *Graminaceæ*. It derives its name, according to Varro, from "tritum," ground or rubbed, because the fruit in its preparation as a food for man undergoes the process of grinding or trituration. The various kinds of wheat have been known from a very early period, and mention is made of wheat as a food in the earliest records of the history of man. Both the Egyptians and Jews made use of wheat as an article of diet, and this food is early mentioned in the Bible. It was also used by the Greeks and Romans, and Theophrastus and Pliny make frequent mention of it. On account of the early cultivation of many of the kinds of wheat as articles of diet, it is impossible to tell where the most common species are really indigenous. All the species of *Triticum* are however found most abundantly in temperate climates, and there take the place of the foods used in the hotter parts of the world. Wheat is in northern climates what rice and maize are in warmer ones. The part of the plant of *Triticum* which yields so large a proportion of the food of man is the fruit, seeds, or grain. This fruit, although small in itself, generally forms a large proportion of the plant. When the fruit is ground, the testa, or seed-coat, is separated from what is called the flour. This flour consists of the powdered albumen and embryo of the seeds. The proximate vegetable principles which this flour contains are starch and gluten. The starch is a highly carbonized vegetable principle, whilst the gluten is characterised by possessing nitrogen. Foods that contain carbonaceous matters are fattening, whilst those that contain nitrogen are strengthening. It is thus that wheat-flour has become to be the staple article of diet of the finest races of men in the world. The other cereal grasses contain the same principles, but the gluten or azotised principle is not in so large a quantity as in wheat, as the following analysis of 100 parts of the organic matter of wheat, rice, and barley will show:—

	Starch.	Gluten.
Wheat... ...	70.00	23.00
Rice...	85.07	3.60
Barley... ...	79.00	16.00

The starch is often separated from the gluten and used for various purposes in domestic economy. [STARCH.] Gluten is identical with Fibrine, and is a form of Protein. [PROTEIN.] The straw of wheat, and the chaff, or the culm, and the flowers, also contains 79 per cent. of organic matter. This consists principally of unazotised vegetable matter, and may therefore be used as an article of diet for cattle. The culms of wheat are also used for the purpose of making plait from which straw hats and bonnets are made, a manufacture of considerable importance in some parts of Europe. *The genus Triticum* is known by possessing solitary spikelets, with the glumes 2-valved and many-flowered; the valves carinate, acute, or mucronate; the paleæ 2-valved; the valves lanceolate, the external one acuminate, the internal one bifid at the extremity. The genus consists of about 40 species; of these 16 are European, and only 5 are natives of Britain. The species are divided into two groups—the *Cerealia*, yielding edible fruits; and the *Agropyra*, which are merely grasses. The latter group is by some writers, as Beauvois and Lindley, made into a distinct genus. It includes all the species that are natives of Great Britain. The *Cerealia* are known by their spikelets being more or less ventricose and turgid, and the valves are ovate or oblong. These are again divided into the *Frumenta*, or True Wheats, in which the seeds fall out from the chaff; and the *Speltæ*, or Spelts, in which the seeds remain attached to the chaff. The most important species belonging to the former division are the following:—

(8317) TRITICUM ÆSTIVUM. WHEAT.

Godumbay arisee, TAM. | Gawn, GUZ.
Gehoon, DUK. | Godoomaloo, TEL.
Gendoom, MALAY.

(8318) TRITICUM DURUM. True Beard-Wheat, has the prominent carinæ of the last wheat, with the valves ventricose, oblong, and three times longer than broad. It is a native of Switzerland. It has several varieties, all of which produce summer wheats, and are better known in Italy, Sicily, and Spain than in this country.

(8319) TRITICUM JUNCEUM, Sea Rushy Wheat-Grass, *T. caninum*, Bearded Wheat-Grass, and *T. cristatum*, Crested Wheat-Grass, are other species of the *Agropyra*. (Metzger, *Die Getreidearten und Wiesengraser in Botanischer und Ökonomischer Hinsicht*, 1841; Koch, *Flora Germanica*; *Cyclopædia of Plants*; Sinclair, *Hortus Woburnensis*; Pouchet, *Traite de Botanique*; Babington *Manual.*)—*Eng. Cyc.*

(8320) TRITICUM POLONICUM, Polish Wheat, has the spike irregularly 4-cornered or compressed; the spikelets 3-flowered; the valves subventricose, oblongo-lanceolate, herbaceous, with many nerves. It is found native in some parts of Europe, not however in the country which gives it its name. In cultivation it yields summer wheats, which are adapted for warmer climates than Great Britain.

The Spelts include the following species:—*T. spelta*, Spelt-Wheat; *T. dicoccum*, Two-Grained, or Rice-Wheat; and *T. monococcum*, One Grained Wheat.

The *Agropyra* do not possess ventricose-turgid spikelets, and the valves are lanceolate or linear-oblong. This division includes the wheat-grasses, some of which are only known as troublesome weeds. The most remarkable instance of this is *T. repens*, Creeping Wheat-Grass Couch-Grass, or Spear Grass. The difficulty of getting rid of its creeping underground stem, the smallest portion of which if left in the ground sends up fresh buds, is the cause of this plant being so great a pest to the farmer. The *T. maritimum*, a native of sea-coasts, seems to be only a variety of this plant.

(8321) TRITICUM SATIVUM. WHEAT.

Gahoon Gioon, Gom, BENG. HIND.

This is now cultivated, with success in many parts of our Indian dominions.—*Ainslie*. Two sorts of this are grown in Mysore. They are called Hot-te Godhi and Jeve Godhi. The difference between them is that the latter is covered with husks like paddy; and the former is without them. Jeve Godhi is only grown in the lands bordering on the Pennar, and the gardens in the Bangalore Division. The Hot-te Godhi is largely cultivated in dry lands in the Chittledroog Division, and the vicinity of Hurrihur. This is the wheat usually employed for making European bread. It is exported to the Neilgherries, and its usual price at Bangalore is a Rupee for ? seers.

(8322) TRITICUM TURGIDUM, Turgid, Cone, or English Wheat, is known principally by its prominent carinæ. About 10 varieties of this species are known to agriculturists, half of which are summer and half winter wheats. Of these the Clock, Great or Revel Wheat, and the Russian, or Blue English Wheat, are the best.

(8323) TRITICUM VULGARE, Common Wheat, has a 4-cornered imbricated spike with 4-flowered spikelets, the valves ventricose, ovate, truncate, mucronate, compressed under the apex, the nerve somewhat prominent. This species includes the *T. æstivum* and *T. hybernum* of many botanists. They appear however to be only varieties of this species, differing in their periods of growth. The native country of this species is not well ascertained: it has been found wild in some districts of Persia, also of Siberia, apparently removed from the influence of cultivation. The *T. hybernum* is the Lammas, or Winter-Wheat, and embraces by far the greater number of varieties which are cultivated as the food of man. The wheats known in Great Britain and on the Continent as Fox, Kentish, Talavera, Bohemian or Velvet, Red, White, and Red-Eared Bearded Wheats, are varieties of *T. hybernum*.

(8324) TRIUMFETTA ANGULATA. See Wight's Icones p. 320.

(8325) TRIUMFETTA LOBATA.

Phetwoon, BURM.

This *Fibrous Plant* is annual and grows to a height of five or six feet, presents a small yellow flower in December, consisting of five petals, and in February presents a small round capsule covered with stiff bristles.—*McClelland*.

(8326) TROCHIDÆ, a family of Turbinated Gasteropodous *Mollusca*. The genus *Trochus* of Linnæus was placed by him between *Murex* and *Turbo*, in his last edition of the 'Systema Naturæ,' and comprized 26 species. M. De Blainville observes that all the species of this family are phytiphagous, marine, and live upon the rocks on the shore of the sea. He divides the group into *Solarium* and *Trochus*.

(8327) *Solarium*.—Animal unknown. Shell orbicular, rolled up (enroulee) nearly on the same plane, or planorbic; spire very much lowered (surbaissee); a large conic umbilicus, with its edges denticulated or not at the entrance; aperture not modified by the last whorl of the spire, which is entirely flat; no columella. Operculum unknown (Blainville). The number of recent species recorded by Woodward is 25, and of fossil 56. The species of this genus hitherto found have occurred in the seas of the warmer climates. The Mediterranean, the Indian Ocean, the coasts of Tranquebar, the South Seas, and those of Australia are the localities recorded by Lamarck. The specimens have been found near the shore—it seems to be a littoral genus—on rocks and weeds.

(8328) *Solarium perspecticum*. Shell orbiculate-conoid, longitudinally-striated, whitish-yellow, with articulated belts of white and brown or chestnut near the sutures; the notches of the umbilicus small. (Lamarck.) Animal with a large foot widened in front, and having a very strongly developed marginal furrow, yellowish on the sides, marked with a black stria above. The head presenting a large escutcheon. The tentacles short, stout, and marked with two longitudinal black bands on the sides. At their base are placed the eyes on very short pedicles. The branchial cavity appeared to be partially divided in two, lengthwise, by a sort of fold. The intestine describes two rather considerable circumvolutions before it passes the liver. Operculum large, oval, membranous, and strongly but sparingly spiral at one of its extremities. The colour is yellowish like that of the whole animal. Messrs. Quoy and Gaimard, who have given this description of the animal in the 'Zoologie' of the Astrolabe, state that they know nothing of the habits of the species, which was brought to them nearly dead by a Malay of Amboyna.

(8329) *Trochus*.—Animal well known, and as characterised above. Shell thick, ordinarily nacreous, trochoid, with the spire sometimes

lowered (surbaissee), and at others rather lofty (elancee) and pointed at the summit; trenchant or carinated on its circumference, umbilicated or not; aperture depressed, angular or subangular, with disunited borders, the right lip trenchant; the columella bent, twisted, and often projecting in front. The number of recent species of *Trochus* given by Woodward is 150, and fossil forms 360. The fossil forms are found in the Devonian rocks.

(8330) *Trochus obeliscus*. Shell conico-pyramidal, nodulous and granulous, coloured with green and white; the whorls tuberculato-nodose, and girt with many granose circles; the last whorl, as it were, removed or taken away (dempto); the lower surface planulate; the lip sinuated at the base. Lamarck gives the Indian Ocean as the habitat of his species. Messrs. Quoy and Gaimard, who captured the individual above described at Tonga, remark that in colour it is *T. obeliscus*, but that it tends to *T. acutus* in its suddenly-pointed spire. Dr. J. E. Gray makes the *Trochidæ* the second family of his *Podophthalma*, the first section of the order *Phytophaga* in his arrangement. The *Trochidæ* are immediately preceded by the *Turbinidæ* and followed by the *Stomatellidæ*. Dr. Gray's *Trochidæ* consist of the genera *Pyramis*, *Cardinalia*, *Trochus*, *Polydonta*, *Ciangulus*, *Phorcus* (*Phorus*?) *Ziziphinus*, *Cunthiridus* (*Cuntharidus*?) *Thalotia*, *Monodonta*, *Gibbium*, *Gibbula*, *Rotella*, *Livona*, *Talopia*, *Cumitia*, and *Delphinula*. ('Synopsis Brit Mus., 1840.) In Woodward's 'Manual,' *Solarium* is referred to *Chitonidæ*, and *Trochus* to *Turbinidæ*.—*Eng. Cyc.*

(8331) TROGON (APALODERMA) REINWARDTII, Temm., is a native of Java and Sumatra, where it was discovered by Professor Reinwardt, whose name it bears. This, Mr. Gould observes, is a scarce bird in cabinets of natural history; and he attributes its rarity to its being very local, remarking that the vast collections brought to this country by Sir T. Stamford Raffles and Dr. Horsfield did not contain an example.—*Eng. Cyc.*

(8332) TROGONIDÆ, a family of Insessorial or Perching Birds, remarkable for the beauty of their plumage. Mr. Gould's splendid 'Monograph of the Trogonidæ' was finished in 1838; and in the 'Introduction' to that work he observes, that those birds, as their general structure and their habits sufficiently indicate, belong to the fissirostral tribe of the *Insessores*. "Greatly insectivorous," says Mr. Gould, "they seize the flitting insect on the wing, which their wide gape enables them to do with facility; while their feeble tarsi and feet are such as to qualify them merely for resting on the branches, as a post of observation whence to mark their prey as it passes, and to which, having given chase, to return. As in all other groups, however, we shall find modifications of the type constituting the ground of generic or subgeneric divisions... If not strictly elegant in form, the Trogons in the brilliancy of their plumage are surpassed only by the *Trochilidæ*: their splendour amply compensates for every other defect. Denizens of the intertropical regions of the Old and New World, they shroud their glories in the deep and gloomy recesses of the forest, avoiding the light of day and the observation of man: dazzled by the brightness of the meridional sun, morning and evening twilight is the season of their activity." The Trogons are described as solitary birds, extremely jealous of their freedom, never frequenting inhabited or open tracts, and delighting in the silence of deserts. "The interior of the thickest forests is their chosen abode for the entire year. They are sometimes seen on the summit of trees; but in general they prefer the centre, where they remain a portion of the day without descending to the ground, or even to the lower branches. Here they lie in ambush for the insects which pass within reach, and seize them with address and dexterity. Their flight is lively, short, vertical, and undulating. Though they thus conceal themselves in the thick foliage, it is not through distrust; for when they are in an open space, they may be approached so nearly as to be struck. They are rarely heard to utter any cries, except during the season of reproduction, and then their voice is strong, sonorous, monotonous, and melancholy. They have many cries, from the sound of one of which their name is derived. All those whose habits are known nestle in the hollows of worm-eaten trees, which they enlarge with their bills so as to form a comfortable and roomy residence. The number of eggs is from two to four and the young are born totally naked, but their feathers begin to start two or three days after their birth. The occupation of the male during incubation consists in watching for the safety of his companion, bringing her food, and amusing her with a song, which, though we should call it insipid, is to her without doubt the expression of sensibility. Some of the Couroucous express the syllable 'pio,' repeated many times in succession with a powerful yet plaintive tone. Their accent almost reminds one of the wailings of a child who has lost its way, and it is thus that they cry to each other amidst the silence of the forests. As soon as the young are able to provide for themselves, they separate from their parents to enjoy that solitude and isolation which appear to constitute the supreme happiness of the species. Their aliments are composed of larvæ, small worms, caterpillars, coleoptera, and berries, which they swallow entire. The male, at various ages, the female, and the young differ in their plumage, which has given rise to the institution of more species than are really in existence." (Griffiths, 'Cuvier's Animal Kingdom.') With regard to the geographical distribution

of the Trogons, Mr. Gould says that they appear, on general survey, to be divided between America, including its islands, and the islands of the Indian Archipelago; two or three species only having yet been discovered on the continent of India, and those principally inhabiting the countries bordering the Indian Seas. The great nurseries for these birds in the Old World are, he observes, the islands of Ceylon, Sumatra, Java, Borneo, &c.; while over the whole continent of Africa only a single species has yet been discovered. The total number of species known when Mr. Gould finished his monograph was 34, 23 of which are inhabitants of America and its islands, 10 of the Indian Islands and India and one of Africa; but he states in the preface that he has reason to believe that many will yet be discovered, both in the Old and New World particularly in those remote regions which civilised man has seldom, if ever, visited.—*Eng. Cyc.*

(8333) TROLLIUS, a genus of Plants belonging to the natural order *Ranunculaceæ*. It has a calyx of 5 or more coloured sepals, 5 or more small petals, which are linear, with an obscure depression above the contracted base; the capsules, or follicles, are numerous, and filled with obovate-angular polished seeds. The species are perennial; they are not numerous, and are found generally in the temperate parts of the world.

(8334) TROLLIUS EUROPÆUS, European or Mountain Globe-Flower, has 10 to 15 sepals involuted in the form of a globe; the petals the same length as the sepals, or a little shorter; the leaves 5-parted with the divisions cut and serrated. The plant is diffused throughout the north of Europe, in moist pastures in sub-alpine districts. It is abundant in the whole chain of the Alps, and is also found in mountainous districts in the north of England, Ireland, Wales, and Scotland. The flowers are large and handsome: in Scotland they are called Luckengowans, or Cabbage Daisies. In some parts of England as well as on the continent of Europe, they are gathered on festive occasions for making garlands and decorating the cottages of the peasantry. There are two species, *T. Asiaticus* and *T. Americanus*, which are found in Asia and America,

(8335) TROPÆOLACEÆ, *Indian Cresses*, a natural order of Plants. The plants belonging to this order are smooth, tender, and herbaceous with diffuse or twining stems, and alternate petiolate peltate leaves; the flowers are irregular, axillary, and solitary; the calyx has 5 sepals, the upper one with a long distinct spur; the petals are unequal and irregular the two upper are sessile and remote, arising from the throat of the calyx, the three lower stalked, and smaller, sometimes abortive; the stamens, 8 in number, perigynous, the filaments distinct; the anthers minute, erect, 2-celled, dehiscing longitudinally: ovary consisting of 3 carpels; style 1, stigmas 3, acute; ovules solitary, pendulous; the fruit is indehiscent, separating into three pieces which surround a common axis; the seeds are large, having no albumen, and filled with the embryo, the cotyledons of which are thick and consolidated together into a single body; the radicle lies within the projections of the cotyledons. The species of this order differ from *Balsaminaceæ* in their more regular flowers, and in the juicy fruit not having a bony lining to the cells. They resemble *Geraniaceæ* in the possession of a spur. The genera belonging to this order are *Tropæolum*, *Magallana*, and *Chymocarpus*, all of them natives of South America.

(8336) TROPÆOLUM. This flower is very common—the colours are yellow, light yellow, and deep orange; and as the plant is a creeper, it is well adapted for trellis work. The leaves are eaten with sallad, and the seed when green sometimes pickled. Is propagated by slips, or seeds, in any good soil.—*Riddell.* Tropæolum is (from τρόπαιον), a genus of Plants, the type of the order *Tropæolaceæ*. It has a 5-parted calyx the upper lobe being furnished with a spur; 5 petals, unequal, the three lower ones smallest or altogether absent; 8 stamens, free from the base; 3 carpels, some what erose, kidney-shaped indehiscent, furrowed, roundish; the seed large filling the cell. The species of this genus, which derives its name from the petiole being inserted into the centre of the leaf, giving it the form of a buckler, are all of them inhabitants of South America. They are all climbing plants.—*Eng. Cyc.*

(8337) TROPÆOLUM ADUNCUM, Hooked Indian Cress or Nasturtium, is a native of both Mexico and Peru.

(8338) TROPÆOLUM AZUREUM, Purple Indian Cress or Nasturtium, has the leaves 5-parted, with linear unequal laciniæ; equal entire bilobed petals, much longer than the calyx, with a spur shorter than the petals. This plant was discovered by Mr. Miers, and first described in his 'Travels in Chili' and had been previously seen by Mr. Bridges on the Carycam de Quillota, 4000 feet above the surface of the sea. It is remarkable for its blue flowers.—*—Eng. Cyc.*

(8339) TROPÆOLUM MAJUS. Great Indian Cress or Nasturtium, has the leaves peltate, nerved, orbicular, somewhat 5-lobed; nerves mucronate; petals obtuse. This plant is also a native of Peru. It was introduced into England, according to Peter Collinson, says Smith, in the year 1616. It has much larger flowers than the preceding, but having the same colour and general appearance. The fruit of this, when green, like the preceding species, is made into a pickle, for which its warm biting character renders it very fit.—*Eng. Cyc.*

(8340) TROPÆOLUM MINUS, Small Indian Cress or Nasturtium has peltate-nerved orbicular leaves, the nerves mucronate at the apex; the petals each ending in a bristle-like point. This plant is a native of Peru. It is one of the species of the genus that was earliest brought to Europe, and was cultivated in England by Gerarde. It has deep yellow flowers streaked with orange and red. The whole plant possesses an acrid flavour and odour which are peculiar to this order and the *Cruciferæ*. It is on this account that all the species of *Tropæolum* have obtained the common name of *Nasturtium*, which is the name of a genus of plants belonging to *Cruciferæ*. The fruit of this plant is pickled, and eaten in the same way as capers; the flowers and leaves may also be eaten as a salad. There is a variety in gardens with double flowers.—*Eng. Cyc.*

(8341) TROPÆOLUM PENTAPHYLLUM, Five-Leaved Indian Cress or Nasturtium, has 5 leaflets which are ovate or ovato-lanceolate, entire, and stalked; only 2 petals, which are sessile, acute, quite entire, shorter than the calyx. It is a native of Buenos Ayres, Monte Video, and Brazil in the province of Cisplatine.—*Eng. Cyc.*

(8342) TROPÆOLUM TRICOLORUM, the Tricolor Indian Cress or Nasturtium, is a native of Chili at Coquimbo. It has a calyx of an orange-scarlet colour, and tipped with black, whilst the petals are yellow. It is the most showy and handsome of the species.—*Eng. Cyc.*

(8343) TROPÆUM, Mr. Sowerby's name for a genus of *Ammonites*, apparently identical with *Crioceratites*, and consisting of those species which have their whorls disconnected, such as *Crioceratites Duvallii*.

(8344) TROPHIS, (from τρέφω,) a small genus of Plants belonging to the natural order *Artocarpeæ*. The species are found both in the East and West Indies. The flowers are dioecious; spike lax, axillary; male, perigone 3 leaved, spreading, stamens 4; female, perigone 3-leaved; ovary ovate, 1-celled, 1-seeded; stigma bifid. The species form milky trees with alternate entire leaves.

(8345) TROPHIS AMERICANA, the Ramoon-tree, is 23 feet high, and a native of the West Indin Islands, where the leaves and twigs make a wholesome fodder for cattle in the inland woody parts of Jamaica. The drupes are about the size of grapes, and have a pleasant flavour.

(8346) TROPHIS ASPERA, is a native of and common in all parts of India; sometimes shrubby, but it also grows into a small crooked tree. Its leaves are oblong, unequally serrate, and so scabrous as to be employed by the natives in polishing ivory. The berries are greedily eaten by birds.

(8347) TROPHIS SPINOSA, another Indian species, less common, is thorny; leaves oblong lanceolate, grossly serrate towards the apex, smooth; female calyx twice the length of the ovary, and eaten by the natives in their curries.—*Eng. Cyc.*

(8348) TROWSER CHECK, is chiefly manufactured in the district of Cuddalore and in the out skirts of Madras, they are of various kinds.

(8349) TRUBU. This is the name of a fish, the scientific appellation of which Crawfurd had not ascertained, but of which the salted and dried roes form a very considerable article of trade in the western parts of the Malayan Archipelago. It seems to be local, and like salmon and some other fish, to frequent rivers for the purpose of spawning. Its favourite resort is the muddy eastern coast of Sumatra, and more especially the narrow strait which divides Bancalis and some other low islands from the main land, and into which the river of Siak disembogues. At a place called Bukit-batu (rock-hill), a considerable fishery of the trubu is carried on, which is thus noticed by Mr. Anderson:—"The river of Bukit-batu is a very small stream, close to the mouth of which stands the town of Bukit-batu, which is a place of considerable trade the grand staple being roes of the trobo-fish, or telur-trobo (trubu, roes, or eggs), as they are called. There there is a very extensive fishery, and three or four hundred boats, with two and three men in each, often go out at a time to the fishery, which is outside the straits of Tanjung-Jati." (Teak tree promontory.)—Anderson's mission, p. 335. The fishery of the trubu is of immemorial antiquity, and is referred to by De Barros as existing on the arrival of the Portuguese just as it does at present." "The rivers" (of Sumatra), says he "contain a great variety of fish, and in some of them, such as that of Siaca (Siak) they catch small shads (saves) of which the people of the country use the roes only, and of these they have a greater abundance than we have of the fish themselves." Decade 3, Book 5, chap. 1.—*Crawfurd Dictionary, page* 440.

(8350) TRUFFLE. A delicate fungus (*Tuber Cibarium*), esteemed a great deli-cacy. They are procured in France, Italy and other countries.—*Faulkner.*

(8351) TRUMPET FLOWER. VIDE BIGNONIA.

(8352) TUBERACEÆ, a section of the sub-order *Gasteromycetes*, of the natural order *Fungi*. It is known by its sporangia being membranaceous, and scattered on a serpentine vein-like hymenium, and included in a concrete uterus. The sporidia are at first pulpy. This section includes the genus *Tuber*, the Common Truffle, and *Rhizopogon*, the White Truffle. The species of these genera are not numerous, and are found very generally diffused throughout the temperate parts of the world, and growing buried beneath the soil. The genus *Tuber* has a closed uterus

marbled internally with veins; the sporangia are pedicillate, and confined to the veins.—*Eng. Cyc.*

(8353) TUBER CIBARIUM, the Common Truffle, is known by its surface being warty and of a black colour. It is found buried in the soil of woods, especially beech-woods, sometimes at the depth of ten or twelve inches or more. It is a native of Europe, and is also found in Japan and the East Indies. It grows abundantly in some parts of England. This is one of the few species of the natural order *Fungi* that is used as an article of diet. For this purpose they appear to have been used by the Greeks and Romans; the latter especially considered them a delicacy. It may be however a question as to whether the Roman 'tuber' is really the common truffle. There can, however, be no doubt that it had a similar form, origin, and use. The truffle when gathered for eating is about the size of a large walnut, and has a very peculiar smell. The flavour is not remarkable, and resembles in some measure that of the mushroom and morel.—*Eng. Cyc.*

(8354) TUBER MOSCHATUM, Musk-Scented Truffle, has a roundish smooth blackish appearance, and is a much rarer plant than the last. It has been found in Great Britain, and is characterised by the musky odour which it gives out.

The genus *Rhizopogon* has a sessile uterus, bursting irregularly, and marbled internally with anastomosing veins and sessile sporangia. The *R. albus* of Bulliard is the *Tuber albus* of older botanists, and is called White Truffle, and by some writers, from its Greek appellation, Root-Beard.—*Eng. Cyc.*

(8355) TUBICOLIDÆ (Lamarck), a family of Conchiferous *Mollusca*. Lamarck observes that the *Tubicolidæ* are undoubtedly conchifers, but of such great singularity, that some among them have been referred to other classes by modern naturalists; and he adds that it is singular to find a bivalve shell inclosed in a testaceous tube, and still more singular to see it incrusted in or built into the wall of that tube, and concurring to complete such wall. The singularity of the *Tubicolidæ*, as well as that of the *Pholades* has, he further remarks, caused a misconception of the real essentials of the shells which belong to the family, namely, two similar, equal, regular valves, articulated by a hinge. As in the shells of the *Tubicolidæ* there are some which have accessory pieces apart from these valves; so, as one sees in the *Pholades*, some naturalists have taken them for multivalve shells, a notion which has given rise to very odd associations. The animals of this family are borers, burrowing in stone, wood, and even in thick shells; but some, nevertheless, live in the sand.

The following six genera are arranged by Lamarck under this family:—*Aspergillum, Clavagella, Fistulana, Septaria, Teredina*, and *Teredo*.

(8356) *Aspergillum Clavagella* and *A. Fistulana*.

(8357) *Aspergillum Javanum* is a native of the East India Ocean. The animal of *A. vaginiferum* has been found by M. Ruppel, and it appears to bear much analogy to that of *Pholas*. It is a native of the Red Sea.

(8358) *Fistulana*. This genus has the sheath tubular, most frequently testaceous, more convex and closed posteriorly, attenuated towards its anterior extremity, open at its summit, containing a free and bivalve shell; the valves equal, and gaping when they are closed. Animal having at its anterior part two cyathiferous calamules. (Lam.) *Fistulana clava*, is a native of the East Indian seas. The *Fistulanæ* inhabiting a free tube have been found in sands or hard mud with the small end of the tube uppermost.—*Eng. Cyc.*

(8359) TUBULIBRANCHIATA, an order of Gasteropodous *Mollusca*, consists of the genera *Vermetus, Magilus*, and *Siliquaria*.

(8360) *Vermetus* (Adanson), has a tubular shell, the whorls of which, in the early age of the animal, form a kind of spire, but afterwards are prolonged into a tube more or less twisted or bent, like those of the tubes of *Serpulæ*.

(8361) *Vermeti* have been found at depths varying from near the surface to twelve fathoms, in sponges, under stones, on shells, in coral-sand, and sand.

(8362) *Siliquaria* (Brug,) resembling *Vermetus* in the head, in the position of the operculum, and in the tubular irregular shell, which has, however, throughout its length a slit which follows all its windings, and which corresponds with a similar slit in the mantle which covers the branchial cavity. Along the whole length of this slit adheres a branchial comb, composed of a great quantity of foliations, distinct and, as it were, tubular. Linnæus placed them with the *Serpulæ*, and Cuvier observes that in these later times some have believed that they belong to the class of Annelids. Thus Lamarck supposed *Siliquaria* as well as *Vermilia* to be approximated to the *Serpulæ*.

Seven recent and ten fossil species have been recorded.

(8363) *Siliquaria muricata*, a native of the Indian Seas, may be taken as an example.—*Eng. Cyc.*

(8364) TUGAR. TIRAIMUN; UPAOON TABERNÆMONTANA CORONARIA. The sweet-scented wood and root are imported from Delhie and Kotah considered and used as a stimulant; but chiefly used in scents.—*Gen. Med. Top. p.* 152.

(8365) TUKHM-GANDAH. A seed from Delhie, considered astringent.—*Gen. Med. Top. p.* 152.

(8366) TUKM-KURPUS. Seed of a plant from Delhie, astringent, and stimulating, given in flatulent indigestion, two Rupees a seer,—*Gen. Med.-Top. p.* 159.

(8367) TUNG OIL TREE, of China. "This," said he, "is the Tung-oil tree, which yields a valuable oil, much used by carpenters; this is the Lew-san tree (Cryptomeria Japonica), valued for its ornamental appearance and fine timber." —*Res. among the Chi. p.* 184.

(8368) TUNICATA, a family of Acephaloid mollusca. Forbes and Hanley, in their 'History of British Mollusca,' describe three genera of *Tunicata*:—

1. *Ascidia*,—Body sessile, covered with a coriaceous or gelatinous tunic; branchial orifice 8-lobed and 6-lobed. There are 16 species of this genus found on the British coasts.

2. *Molgula*, E. Forbes.—Body more or less globular, attached or free, with a membranous tunic, usally invested with extraneous matter; orifices on very contractile and naked tubes; the branchial 6-lobed, Two species are British.

3. *Cynthia* of which there are 13 species.—*Eng. Cyc.*

(8369) TUPAIA, Sir T. Stamford Raffles's name for a genus of *Mammalia* which Dr. Horsfield places among Cuvier's Insectivorous Carnassiers, the *Feræ* of Linnæus, and the *Fulculata* of Illiger. It has the following generic characters:—Head oblong depressed. Snout long, equally attenuated; nostrils lateral, semilunar. Eyes very large, and rather prominent. Ears large and oblong. Body cylindrical, covered with close fur and soft hairs. Tail longer than the body, linear, compressed. Feet plantigrade and pentadactyle, the soles naked the toes compressed and the claws falcular. In the Malayan language the name of *Tupai* is a general term for various small animals which have the external form and agility of the squirrel.

(8370) TUPAIA JAVANICA; Bangsring, or Siusring, of the Javanese. Dr. Horsfield says that this species has the appearance of a sprightly animal, a character with which its manners, as far as they are known, perfectly agree. "Its body," says Dr. Horsfield," is graceful and handsomely formed, and its limbs are slender and fitted for great agility: its size and exterior habits so nearly resemble the individuals of that family which Illiger has denominated *Animalia Agilia*, that, on a superficial view, it has been considered to belong to it. Our animal agrees with one of the most numerous sections of this family, the Squirrels, in the form of the body, the proportional length of the extremities, the breadth of the tail, and the faculty of carrying it on the back as a plume; but the succeeding details will show that its structure and organisation are essentially different."

Dental Formula —Incisors, $\frac{2}{6}$; Canines, $\frac{2}{2}$; Molars $\frac{14}{12}$.

Dr Horsfield describes the claws as sharp, compressed, and curved; and, in comparison with those of *Sorex* and several other genera of this order, of considerable strength: they are, he observes, individually supported by a small protuberance similar to that which is found in the *Tarsi*; and the construction of the claws in the Bangsring is adapted, he remarks, to the same food and habits as those of the other species of *Tupaia*. The linear tail, of the same length as the body, is compressed, with the hairs spreading far on each side; but, adds Dr. Horsfield, it is less full and ornamental than in the Squirrel. The fur of the Bangsring is close, silky, and delicate, with a few longer, more rigid, and darker-colored hairs dispersed among the long and straight hairs closely applied to the skin, with which the back, neck, sides, tail and extremities above are furnished. The upper parts are brown slightly diversified with gray of different shades; the lower parts dirty white, with a slight tint of grayish: the tail agrees with the upper parts; and the scapular line, is nearly an inch long.

The Bangsring fell under Dr. Horsfield's observation during an early period of his researches in Java. In traversing the province of Blambangan, in 1806, he discovered it in the extensive forests which almost entirely cover the eastern extremity of the island; and he thinks that its range, though it may not be confined exclusively to that province, is extremely limited.

Sir Stamford Raffles states that a tame *Tupaia ferruginea* [illegible] suffered to go about at perfect liberty, ranged in freedom over the whole house, and never failed to present himself on the breakfast and dinner table, where he partook of fruit and milk.—*Eng. Cyc.*

(8371) TURANJ-BIJ, Turanjabeen, Saccharine grain imported from Bombay used in purges; one seer costs ten rupees.—*Genl. Med. Top. p.* 153.

(8372) TURBANDS, COTTON. The principal site of this manufacture formerly was the Town of Arnee in the Chingulput district, but they are now made at Oopada in the Rajahmundry district and also in the district of Madras.

(8373) TURBANDS, SILK. The principal site of the manufacture of these silk Turbands was Seringapatam in Mysore. They are of a pink colour and are sold at from Rupees 10 to 25 Rupees each.

(8374) TURBINIDÆ, a family of Gasteropodous *Mollusca*. Linnæus places his genus *Turbo*, in his last edition of the 'Systema Naturæ', between *Trochus* and *Helix*, with the following characters:—Animal a *Limax*, or Slug. Shell univalve, spiral solid. Aperture narrowed, orbiculate, entire. In Woodward's 'Manual of the Mollusca' the

Turbinidæ are thus defined ;—Shell spiral, turbinated or pyramidal, nacreous inside; operculum calcareous and paucispiral, or horny and multispirial. Animal with a short muzzle; eyes pedunculated at the outer bases of the long and slender tentacles; head and sides ornamented with fringed lobes and tentacular filaments (cirri); branchial plume single; lingual ribbon long and linear, chiefly contained in the visceral cavity; median teeth broad; laterals 5; denticulated; uncini very numerous (sometimes nearly 100), slender, with hooked points. The shells of nearly all the *Turbinidæ* are brilliantly pearly, when the epidermis and outer layer of shell are removed. Many of them are used in this state for ornamental purposes. The following genera are embraced in the family thus defined.—*Eng. Cyc.*

(8375) *Turbo.* Shell turbinated, solid; whorls convex, often grooved or turberculated; aperture large, rounded, slightly produced in front; operculum shelly and solid, callous outside and smooth, or variously grooved and mammillated, internally horny and paucispiral. In *T. sarmaticus* the exterior of the operculum is botryoidal, like some of the tufaceous deposits of petrifying wells. Animal with pectinated headlobes. There are 60 recent species which are found principally in tropical seas. The fossil species amount to 360, found in the Lower Silurian rocks.

(8376) *Phasianella.*—Shell elongated, polished, richly coloured; whorls convex; aperture oval, not pearly; inner lip callous, outer thin; operculum shelly, callous outside, subspiral inside.

The *Phasianellæ* are always smooth. This polish, and still more their continual movements, prevent them from being covered with *Serpulæ*, *Flustræ*, and other parasites which encrust sluggish shells. This agitation makes it difficult for them to preserve the contour of their aperture perfect, for it is very frail. Woodward records 25 recent and 70 fossil species.

(8377) *Imperator* has the shell trochiform, thick, with a flat or concave base; whorls keeled or stellated; aperture angulated outside, brilliantly pearly; operculum shelly. The species, about 20 in number, are found in South Africa, Australia, and New Zealand.

(8378) *Trochus.* [TROCHIDÆ]

(8379) *Rotella.*—Shell lenticular, polished; spine depressed; base callous; lingual teeth 13; uncini numerous, subequal. There are 10 species found in India, the Philippines, China, and New Zealand.

(8380) *Monodonta.*—Shell turbinated, few-whorled; whorls spirally grooved and granulated; lips thickened internally and grooved; columella toothed, more or less prominently and irregularly; operculum horny and many whorled. There are 10 species found in West Africa, the Red Sea, India, and Australia.

There are 80 fossil species.

(8381) *Stomatella.*—Shell ear-shaped, regular; spire small; aperture oblong, very large and oblique, nacreous; lip thin, even-edged; operculum circular horny, multi-spiral. They are found on reefs and under stones at low-water.

Twenty species are recorded from the Cape, India, North Australia, China, Japan, and the Philippines.

(8382) *Broderipia*, Gray.—Shell minute limpet-shaped, with a posterior submarginal apex; aperture oval, as large as the shell, brilliantly nacreous. Three species are found in the Philippines, Grimwood's Island, and the South Seas. (Cuming).

(8383) TURBITH, (MINERAL). The name given by chemists to the sub-sulphate of mercury.

(8384) TURBITH, TURPETH. The cortical part of the root of a species of *Convolvulus* brought from different parts of the East Indies. It is a longish root, about the thickness of the finger, resinous, heavy, of a brownish hue without; and whitish within. It is used in medicine —*Lewis's Mat. Med.*

(8385) TURBOOZ —CUCURBITA CITRULLUS.—Water Melon. This is grown in the bed of rivers in the hot season, but may be cultivated in gardens during the rains.—*Riddell.*

(8386) TURBOT. RRACHIRUS: A small flat Tenasserim fish with the aspect of the turbot, with two pectorals, the dorsal, caudal and anal united, and of a dark grey colour on the upper or right side, is sometimes in market.—*Mason.*

(8387) TURDUS. THRUSH. M. Homeyer has discriminated the Missel Thrush common in the W. Himalaya from *Turdus viscivorus* of Europe and has designated it *T. Hodgsoni:* it certainly does appear to be somewhat larger than the European bird, with more of the albescent hue on the outer tail-feathers; and these differences must be admitted to be appreciable, however trivial, and whatever may be the value to be rightly attached to them: that, however, is a subsequent consideration, in which zoologists are never likely to concur; but all will admit that every appreciable difference should be noted, whether or not it be desirable that a new specific name should be imposed in every such instance.—*Cal. Rev.*

(8388) TURMERIC.

Zur-wood, Tam.	Curcuma, LAT.
Arsina, CAN.	Zard-choobeh, PERS.
Tumr, EGYPT.	Kurkum, HIN.
Keang-whang, CHI.	Haridra, SANS.
Hulhad Huldee, [illegible]	Munjil, TAM.
Hullud (an [illegible] kind), [illegible]	Passapeo, Pambi, TEL.
Turtumagi [illegible]	Mangellacua, MAL.

The dried roots or bulbs of a tropical plant (*Curcuma longa*), are oblong, tough, externally yellowish-gray, and internally of a deep yellow

colour, with an aromatic smell, and a bitterish acrid taste. In India turmeric is used as an ingredient in curries, in dyeing, in medicine, and in some of the religious ceremonies of the Hindoos. It is produced in Bengal, Java, China, Malabar, and other places.—*Faulkner.* This article of commerce is furnished by the branches of the rhizome, or root-stock of the Curcuma longa, and C. rotunda, plants which are natives of Eastern Asia, but have been grown in England and the West Indies. They thrive well in a rich light soil, and are readily increased by offsets from the roots. In the East Indies, where it is known as Huldee, turmeric is much employed in dyeing yellow principally silks, but the color is very fugitive. It is also used medicinally as an aromatic carminative and as a condiment it enters into the composition of curry sauce or powder, and many other articles of Indian cookery. It is cordial and stomachic, and considered by the native doctors of India an excellent application in powder for cleansing foul ulcers. It is grown in and exported chiefly from Bengal and Malabar, Madras, Java, and China. The turmeric of Java is in high estimation in the European markets, ranking next to that of China and being much superior to that of Bengal The price of turmeric in London is from 32 s. to 20 s. per cwt., according to quality. The entries for home consumption are about 4,000 to 5,000 cwts. annually. It is better shipped in casks or cases than in bags. A kind of arrow-root is prepared from C. angustifolia another species of this tribe of plants. Amaranthus gangeticus, and another species, are much cultivated by the Hindoos for their stews and curries. The quantity and value of the curry stuff imported into Ceylon chiefly from India has been in the last few years as follows ;—

Quantity.

Years	cwt	Package.	Value.
1847	.....	.....	6,866
1848	.....	.....	9,981
1849	29,347	109	9,664
1850	24,399	300	7,267
1851	31,550	.....	9,446
1852	.....	.....	9,036

"Curry stuff" was imported to the extent of 32,000 cwt. in 1852. There are two varieties of turmeric usually sent into Europe from the East (whence all the turmeric imported into Europe is obtained), the "long" turmeric (*Curcuma longa*), and the "round," or as it is better known the "Chinese turmeric." The latter description is very rare, the former is the common article of commerce. According to one correspondent, Mr. Hepburn, chemist, of Falmouth, Jamaica, the common or long turmeric is indigenous in rather damp, soils, its locality being in the vicinity of rivers, watercourses and sporings. In this respect it differs from ginger, which requires a rather dry soil for its culture. Simmonds is not aware that this plant possesses the property of impoverishing the soil like the ginger. From the general habits of the plant in its natural state, we may gather the following rules for our guidance in its culture. The plants should be laid down in rows of five or six inches distant from each other, in a soil moderately damp, of an aluminous or clayey nature, and free to a great extent of the more soluble alkalies, potash and soda, as these, by absorption, may destroy the coloring matter of the plant, and so diminish its value as a dye-stuff. Finally, in preparing the roots for exportation, they should be cleansed from all earthy practicles, exposed for drying in the shade, and without any further preparation bagged for shipment. The coloring matter of turmeric is of an orange yellow color, exceedingly delicate and capable of change, either from the action of light or of alkalies, which turn it to a dark brown color. It is slightly soluble in water, and readily soluable in an alkaline solution, becoming dark brown. Alcohol extracts the coloring matter. The uses to which turmeric is applied are two : as an ingredient in the curry powder and paste, and as a dye for silk. It was some time ago used as a medicine ; but though retained in the "Pharmacopœias" of the present day, it is entirely discarded by the practitioner as a curative agent. The best Bengal and Malabar turmeric fetches a price nearly as high as that of ginger, and there is no reason why the West India planter could not send it into the British market quite as cheap as the East India trader. According to Dallas, 397 bags of turmeric were exported from Jamaica in 1797. Turmeric is grown about the city of Patna and Behar. It is much cultivated about Calcutta and all parts of Bengal. One acre yields about 200 lbs. of the fresh root. It is also grown on the central table land of Affghanistan. The exports from Calcutta in 1841 were 11,000 Indian maunds, and 28,137 in 1842. The value of that exported from Madras in 1839 was 40,000 rupees, or £4,000 ; in 1840 £4,200. The quantity shipped from that Presidency in 1850 was 6,877 bags. In the neighbourhood of Dacca about 200 lbs. of seed is sown to the beegah, measuring 80 cubits by 80, and the yield is from 640 to 800 lbs. 140 tons were imported into Liverpool in 1849, for dyeing and for curries ; 414 tons in 1850 ; 11,554 bags and packages in 1851 ; and only 3,595 ditto in 1852. The price in January 1853 was, for Bengal, 10s. to 12s.; China, 12s. to 14s., and Malabar 9s. to 11s. the cwt. The imports into London were 18 tons in 1248, 191 tons in 1848, 260 in 1849, and 870 tons in 1850, In China turmeric is used with Prussian blue in coloring and facing tea.—*Simmonds.*

Specimens at the Madras Exhibition of 1855. were exhibited as a root from Trichinopoly,

Tinnevelly, Madura &c. and in a prepared state from Goa. The root affords a yellow dye which is brilliant, but not permanent. It enters into curries and is largely used by native females as a paste to colour their faces. Dr. Pereira considered Madras Turmeric "as the most showy of all kinds of Turmeric," and the Jury observe the tubers are very large and the colour a bright yellow.—*M. E. J. R.* Turmeric is now imported into England to the extent of upwards of 800 tons, a portion of this is used in dyeing. Besides using turmeric for both food and medicine, the Burmese and Karens dye with it a bright yellow, but it is not very permanent.—*Mason.*

Turmeric, its adulterations.—From what has been shown above it will have been seen that Turmeric powder consists of the ground tubers of Curcuma longa, a plant which is extensively cultivated in the neighbourhood of Calcutta, in Bengal as also in China and Cochin China. The bulbs are small and furnished with numerous long palmate tubers, internally of a deep orange colour. There are two descriptions of tubers the one round, the other long; but both are yielded by the same plant. The first are round, oval or ovate, about two inches long, and one inch in diameter, pointed at one end, and marked externally with numerous annular wrinkles. The second are cylindrical, not exceeding in thickness the little finger; two or three inches long, somewhat contorted, tuberculated. Both kinds are yellowish, externally more or less orange yellow, passing into reddish-brown. The fractured surface has a waxy appearance. The odour is aromatic, somewhat analogous to ginger, but peculiar; the taste is aromatic. When chewed, it tinges the saliva yellow. Its powder is orange yellow. The tubers are frequently worm-eaten. The following varieties of turmeric are known in the English markets, and are thus described by Dr. Pereira:—

1. *China Turmeric.*—This sort consists of smooth, plump, round, and long tubers, of a greenish hue extenally. They yield a bright powder, and on that account are much preferred for medical purposes. Thence they fetch a higher price than any other sorts of turmeric. Probably if much of it were brought to market it would not fetch more than the Bengal sort.

2. *Bengal Turmeric.*—This sort consists of thin or narrow long tubers which are moderately smooth externally, and of a greyish dull yellow colour. They break with a deep reddish fracture. Although from the dull appearance of its narrow tubers, it is not a very inviting sort to the inexperienced eye, yet it fetches a higher price than the Madras sort, on account of its being a much stronger dye.

3 *Madras Turmeric.*—This is the most showy of all the kinds of turmeric. It consists principally of large long tubers, but mixed with transverse sections of round tubers. Externally the tubers are marked by longitudinal wrinkles, the surface of which is rubbed and bright yellow, internally the colour is that of a fresh fractured surface of gamboge.

4 *Malabar Turmeric and Bombay Turmeric.*—The sort is not constantly found in the market. It consists principally of long tubers, the round tubers being few, and of a very inferior quality. This sort of turmeric is smaller and more shrivelled than the Madras sort, but otherwise somewhat resembles it.

5 *Java Turmeric.*—Not frequently found in the English market, in a general way it may be said to resemble the China sort. It consists of both round and long tubers, but chiefly the latter. They have a greenish-yellow hue. Under the name of bulbs of Batavian Turmeric, Dr. Hassall received a sample of round tubers, said to be from Java. Dr. T. Martius notices this sort as having been brought, for many years, from Batavia, and adds that it contains much colouring matter, and is probably the produce of Curcuma viridiflora.

The composition of Turmeric is shown in the following Analysis.

John's Analysis.

Yellow volatile oil	1
Curcumin,	10 to 11
Yellow extractive	11 to 12
Gum,	14
Woody fibre,	57
Water and loss,	7 to 5
	100

Vogel and Pellitier's Analysis.

Acrid volatile oil.	Starch.
Curcumin.	Woody fibre.
Brown colouring matter.	Chloride of calcium.
Gum (a little)	Turmeric.

The wood curcumin is applied to the resinous colouring matter of turmeric, which is soluble only in ether. The cheapness of turmeric-powder and the comparatively small quantity of it used explain the reason of its having hitherto not reached the hands of the adulterator. Turmeric is free of duty. Wholesale price, 6 s. to 14 s. per. cwt. —*Food and its Adulterations, p.* 296.

(8389) TURNIPS.—Brassica Rapa. In general grow indifferently at Madras, require a free light soil; for growing this vegetable, the manure applied to the soil ought to be kept near the surface, there is one variety, the yellow Maltese worthy of a trial on the plains; raised from seed sown broad cast, when the plants have formed a few leaves they should be thinned to about 6 inches apart; used in soups, stews, &c. —*Jaffrey.*

(8390) TURNIPS, ANNUAL, are cultivated in all parts of the Deccan at the commencement of

the rains and the cold weather. They continue until the latter end of February, and go to seed easily. The soil should be rich and light, and they may be sown broad-cast, and then transplanted, either in rows or ridges, and a space of at least six fingers' breadth allowed between each. In the rains a small caterpillar is bred on the leaves, which, if not removed, will destroy the whole. The sorts are white, and red; one species grows above the ground.—*Riddell.*

(8391) TURPENTINE.

Ratenuj-roomie. Butum, Arab.	Teebinthina, Lat.
Terebenthine, Fr.	Kota, Nep.
Turpentin, Ger.	Zungbarie, Pers.
Turpintine, Guz. Hind.	Terpentyna, Pol.
Trementina, It.	Skipidar, Rus.
	Kelon ka tel, Hind.

A name for several juices of trees, chiefly of the pine tribe. They agree in most of their properties, being originally fluid and transparent, of strong and rather pleasant odour, and a pungent taste; inflammable, and soluable in oils, alcohol, and ether, but not in water. Turpentine is largely employed in the arts, especially in painting and varnishing, also in surgery —*Waterston.* The sources are as under.

(8392) *Larix* (or Cedrus) *Deodara* (Deodar and Kelon), or Himalayan Cedar, is an elegant and lofty tree, hardy as the Larch, and yielding valuable timber. It has been extensively introduced into England by the East India Company, and is interesting as having been long employed in medicine by the Hindoos, and known even to Avicenna. (*Hindoo Med.* 36.) Its Turpentine, known by the name *kelon-ke-tel*, is in great repute in the North-west of India, from its stimulant properties and power of healing deep-seated ulcers, as in elephants and camels.—*Royle.*

(8393) *Turpentine. Common. Terebinthina Vulgaris.* L. D. Resina liquida, L. Fluid Resin of Pinus sylvestris, *Linn.*, of various species of Pinus and of Abies, E. Common Turpentine either exudes naturally or from incisions from most trees of the Pine tribe, as also from *Pistacia Terebinthus* (*page* 333). It consists of Resin intimately mixed with a Volatile Oil, known in its separated or distilled state as Oil of Turpentine. In time, all Turpentines become converted into Resins, from the evaporation of the Oil and by its oxidation. They all soften by heat, burn readily, are soluble in Alcohol and Ether, unite with the fixed Oils, and resemble each other very closely in taste and smell; but differ in being more or less white or dark-coloured, and in the odour and taste being more or less agreeable. Water acquires only a little of their properties, but they may be made into an emulsion with eggs or vegetable Mucilage. Common Turpentine used to be procured from *Pinus sylvestris*, as it still is in many parts of Europe, and also from *P. maritima*, which yields the Bourdeaux Turpentine, and in winter the *galipot* of the French But Dr. Pereira has shown that almost the whole quantity of Turpentine imported to England is from America. This is procured chiefly from *P. palustris*, partly also from the *P. Tæda*. This Turpentine is viscid, semifluid, of a dull light yellowish colour, with a warm, acrid, rather bitter taste, and a moderate terebinthinate odour. When fresh, it yields 17 per cent. of Oil of Turpentine. (*W.* and *B.*) The Bourdeaux Turpentine is whitish, turbid, separates upon standing into a transparent liquid and into a granular honey-like semifluid. It is acrid and nauseous in taste, and of a disagreeable smell; yields about 20 per cent. of Oil. M. Faure discovered that it might be solidified by the aid of a 32nd part of Magnesia. Common Turpentine yields Oil of Turpentine and Resin, q. v., and is a constituent of Ung. Elemi (p. 345) and of Emp. Galbani (p. 424). —*Royle.*

(8394) *Venice Turpentine. Terebinthina Veneta* E. D. Fluid Resinous exudation of *Larix europæa.* Venice Turpentine. This, when genuine, is a thick tenacious fluid, usually of a cloudy appearance, of a yellowish-green tint, acrid and bitter in taste, of a strong peculiar odour. It is sold in Paris as Strasburgh Turpentine, and is distinguished by being less liable than others to solidify. (*Guibourt* and *Pereira.*) Dr. Thomson stated long since that the Venice Turpentine of the shops was imported from America: this is therefore only a substitute. What is usually sold is a mixture of Oil of Turpentine with common Resin. Venice Turpentine is intended to be a constituent of Emp. Cantharidis, E. and of Ung. Infusi Cantharidis, E.—*Royle.*

(8395) *Canada Balsam. Terebinthina* (Balsamum, E. D.) *Canadensis* L. Fluid Resin of Abies (Pinus, L. D.) balsamea. Canada Balsam is procured by breaking the vesicles which naturally form upon the trunks and branches, and then collecting their fluid contents. It is often called Balm of Gilead. When fresh, it is nearly colourless, of light yellow colour, transparent like thin honey; solidifies slowly; is of a strong, rather agreeable odour, and a bitterish, rather acrid taste. It is also obtained by making incisions into the tree. Strasburgh Turpentine is sometimes substituted for it.—*Royle.*

(8396) *Abietis Resina.* L, Thus, D. Resin of Abies excelsa, E. (*Pinus abies*, Linn.), L. D. The Resin of the Norway Spruce Fir may be arranged with the Turpentines as being a spontaneous exudation, and with the Resins as having lost by evaporation most of its Volatile Oil. It used to be called *Thus*, or Frankincense, as it still is in the D. P. It is collected in the form of concrete tears, which are hard and brittle, but soften readily at the temperature of the body. It is of a light yellowish or brownish-yellow colour externally, lighter within; slight terebinthinate odour and acrid bitter taste. This Resin

is intended to be employed in making Pix Burgundica, Emp. Aromaticum, D. p. 541, Emp. Opii, L. E. D., Emp. Thuris, D. p. 129, Emp. Galbani, L. D., and Emp. Picis, L. E. The substance which the French call *galipot*, or *barras* is the concretion produced on the Pine of the Landes, late in the year or in winter, when the collection of Bourdeaux Turpentine has ceased.

(8397) *Pinus morinda.* A very fine Resin is spontaneously yielded by the Himalayan *Pinus Morinda.*—*Royle.*

(8398) *Pix Abietina, L. Pix Burgundica*, E D. Burgundy Pitch is the Resin *Abies excelsa* melted in water immediately after being scraped from the tree, and strained through a cloth. It is thus freed from mechanical impurities, with a loss of little of its Volatile Oil. In all other respects it corresponds with it. But most of that which is sold is a factitious compound of Resin rendered opaque by the incorporation of water, and coloured by Palm Oil, or made from concrete American Turpentine. (*Pereira.*) This is used for making a Plaster as well as the Emp. Calefaciens (*v.* Cantharidis Comp. E.)

Action. Uses. The above Resin and Pitch are both Rubefacient.

(8399) TURPENTINE OIL. SPIRITS OF TURPENTINE.

Eau de raze, FR.	Acqua di rasa, IT.
Turpentinol, GER.	Aguarras, SP.
Turpentine, GUZ. HIND.	

The essential oil drawn from turpentine by distillation. There are two sorts; the best, red, and the other white. Turpentine oil is extensively used in the manufacture of varnishes, &c.—*McCulloch.* The Oil of Turpentine, distilled from the Turpentine of the common long-leaved Fir, of the Himmalayas is considered 'in a letter from Mr. Hutchinson, to be of 'very superior quality.'—*Royle's Productive Resources of India.*

(8400) TURQUOISE.

Turquoise, FR.	Turchina, IT.
Turkiss, GER.	Turquesa, SP.

A precious stone, in considerable estimation. Its colour, which is its principal recommendation, is a beautiful celestial blue, which migrates into pale blue, and is sometimes tinged with green. It is destitute of lustre, opaque, and does not admit of a very high polish. It is much worn in necklaces, and every part of ornamental jewellery, and contrasts beautifully with brilliants or pearls, set in fine gold.—*Mawe on Diamonds. Turquoise (Calaite, Odontalite)*, a Mineral occurring in botryoidal or mammillated masses. Colour greenish-blue, of various shades. Fracture conchoidal, rough, and uneven. Commonly opaque; sometimes translucent on the edges. Streak white. Hardness 5-0 to 6-0. Specific gravity 2-8 to 3-0. It occurs in alluvial clay in Persia. It has been found to consist of—

Phosphoric acid	30.90
Alumina	44.50
Oxide of Copper	3.75
Oxide of Iron	1.80
Water	19.00
	99,95

The Occidental Turquoise, found near Simon, in Lower Languedoc, is stated to be merely bone coloured by phosphate of iron. According to La Grange, it consists of—

Phosphate of Lime	80.0
Carbonate of Lime	8.0
Phosphate of Iron	2.0
Phosphate of Magnesia	2.0
Alumina	1.5
Water	1.6
	95.1

(8401) TURRÆA, a genus of Plants belonging to the natural ordea *Meliaceæ*, named in honour of an Italian botanist, G. Turra of Padua. Many of the species are highly ornamental forming trees or shrubs in the interior of the Cape of Good Hope, in Madagascar, Mauritius, and in the eastern parts of India.

(8402) TUSBEEH, rosary or chaplet of beads, made of date stones: fish bones: cornelian: Mocha stones: pearls: mother of pearl: coral: the seeds of the Canna Indica or Indian shott, olive stones, onyx, ebony; ocimum pilosum basilic basil; Agati: the seeds of the Corypha umbraculifera, the Earth of karbillah, Sandal: and the stones of the Cicca disticha, chlulimilli or churmayla.—*Herklots.*

(8403) TUSSAH, *Tam.* DASARI. A species of silk goods prepared from a wild Silk, in some districts in Bengal, of a fine description much used for ladies and children's dresses, and in most parts in India for Native use being worn by them for certain ceremonies and while bathing: it has lately become an article of export. *See Silk.* In an account published by Dr. Walker (Journal As. Soc. No. 31) the following history is given of the production and preparation of the tusser silk. The tusser breeders are a class quite distinct from the weavers, and are either Telingas of low caste or Gonds; the former reside principally at Chilpore, Madapore, and Chinnore. At Madapore, which may be regarded as the centre and head quarters of the tusser breeders there are at least seventy families. The tusser breeder never thinks of keeping up the breed of the insect throughout the year. When the leaf is off the tree about the middle of March he deems his occupation gone, and he leaves the object of his former excessive care to shift for itself thinking of nothing but the present ease which may be summed up in a few words, sloth, a bare subsistence and an occasional debauch in his nectar, palm toddy. But with the rains returns his toil, and some

little difficulty is experienced in procuring insects for a fresh campaign. If he can gather a dozen of promising cocoons which his experience tells him are of females, he is quite satisfied. Carefully does he watch the bursting of the cocoon, and much care does he take of its winged inmate, having previously prepared for it a house of teak leaves dried. The male is not tardy in approaching. Impregnation takes place, the male dies, and in four days after laying her eggs, the female also. The eggs are in number about sixty: of these one half prove abortive while the others are hatched in ten days. The small insect is fed on the tender leaves of the Careya sphærica, and in six weeks spins its cocoon; the first brood are spared and allowed to burst their cocoons to supply a sufficient quantity of ova for the tusser harvest, the same process is described as again gone through, with this exception, that the young worms are are this time fed on the leaves of the Pentaptera tomentosa, as those of the Careya sphærica are by this period of the season, supposed to have acquired some influence noxious to the insect. It is during the progress of the worm from the egg to the formation of the cocoon that every energy of the Tusser breeder is called into action for the preservation of his charge. Every animal footed, winged and creeping, is said to be the enemy of the tusser grub. Ants destroy them, kites and cows prey on them, snakes devour them, and squirrels are said to make a repast of them. To protect them first from their insect enemies, the tusser breeder, ascends the muddy tree (Pentaptera tomentosa) the leaves of which are the insects food, every branch he carefully clears of the different species of ants by which they may be infested preventing the access of others by surrounding the trunk of the tree at its foot with ashes. The other enemies are kept off by shouting, throwing stones, firing guns &c. Their life at this time would appear by their own account, to be one of the most unremitting toil, to devote themselves to which they forswear not only every indulgence but evey comfort, and it rouses the apathetic peasant of Telingana to eloquence when he recounts what privations he undergoes, what pleasure he derives himself, and what incessant labour he incurs, while watching the rearing of the worm, and the perfecting of its work. The tusser butterfly is a species of Saturnia, probably the aphia, described by Dr. Helfer as the most common of the native species. From four to five hundred of the cocoons are sold to the Banyas and weavers for one rupee: the moth is killed by means of heat. There are three tusser harvests one at the end of the rains, the other two in the cold season. The winding of the silk is accomplished by boiling the cocoons, separating the floss, of which no use is made; and twisting eight or ten filatures from as many cocoons on the middle of the thighs with the left hand of the workman and to be wound on the instrument; this instument, the middle bar of the wood, is held lightly in the hand of the workman and made to move in a semicircle. An ounce and a quarter of silk is the average daily winding of a single workman, his wages are at the common rate of one pice for winding the silk of fifty cocoons, about three pice a day, as he cannot wind more silk than from a hundred and fifty cocoons. The pice, however, are large, and go there by eight to the rupee. The only dyes used for the tusser silk, as far at least as my observation or inquiry has gone, are the flowers of the palas, *Butea frondosa*, and turmeric; by the former the usual familiar colour is produced; by the latter a golden yellow is brought out after the threads are for sometime immersed in a solution of ashes. The warp threads are stiffened with rice congee.—*Rohde, M. S. S.*

Tusser or Jungle Silk, the produce of a Saturnia, is made into sarees, punchees and scarfs, at several towns of the Sircar of Warungul. But the chief seat of the Tusser manufacture is the town of Mahdapore—on the right bank of the Godavery in the Ramgheer Sircar, where the moth that yields it is carefully reared, and from whence raw tusser silk is sent to other parts to be woven into cloth. The insect in its grub state is first fed on the tender leaves of the Careya sphœrica, and when more grown, on the leaves of the Pentaptera tomentosa—much watching and attention are bestowed in rearing the animal, subject as it is to destruction from birds, insects, and squirrels. The Tusser cloths produced at Mahdapore are in durability and fineness very inferior to the cloths of the same kind manufactured in Bengal—they are dyed the same colour, and with the same materials as the silks of which they are about one half the price. At Mahdapore there are seventy to eighty families employed in rearing the insect and the manufacture of the cloth, which is prepared principally for the Hyderabad market. Cuth. Davidson, Assistant Resident. At the Madras Exhibition of 1855, Cocoons, from which this description of silk is obtained, were exhibited from several localities. They are formed by caterpillars of several species of moth, belonging to the genus Saturnia. That which is most commonly met with in Southern India, appears to be S. Pahia. The caterpillar feeds on the leaves of the country Almond tree (*Terminalia catappa*) where it is often called the almond moth. It is also found on the leaves of the Ber tree, (*Zizyphus jujuba,*) the Casuarina, &c. The cocoons are ingeniously attached to the twiggy branches of the Ber, by a long stalk terminating in a ring, encircling the branch. In the thicker foliage of the Casuarina, the silk is woven among the leaves without the above provision. It does not appear, that silk in any

quantity has been obtained from this source in the Madras Presidency. Considerable quantities of the small silk cloths worn by Brahmins at their meals are imported into the Northern Circars, from Cuttack. The only use to which the cocoons appear to be turned is that of a ligature for native matchlocks. They are cut spirally into long narrow bands, with which the barrels are tied to the stocks. Dr. Roxburgh in the 7th vol. of the Linnean Transactions, has described the preparation of the Tussah silk of Bengal, which is derived from two different species of Saturnia. One called *bughy* by the natives of Beerbhoom, appears to be the same as the Madras species, (S. Paphia,) and is stated to feed on the Ber tree and on the Asana (*Pentaptera glabra*). The other termed *jarroo* by the natives of the same province, is the S. Cynthia, and is domesticated. The caterpillars are fed on the leaves of the castor oil plant (Ricinus) whence it is called the Arrundy, or Arundi silk worm, but it also eats the leaves of the Ber and Asana. Colonel Sykes has a paper in the 3d vol. Trans. Roy. As. Socy. Lond. on the cocoons of S. Paphia found by him in the Deckan under the designation of the *kaliswar* silk worm, which he states is met with on the Ber tree (*Pentaptera glabra*), Teak tree and common Mulberry. The Chinese Tussah is said to be obtained from *Saturnia Atlas*, which is also to be met with in Southern India. Another species of Saturnia (*S. Selene*) the posterior wings of which are prolonged into a tail-like process is common in Southern India. The caterpillar may be observed, feeding in considerable numbers on the Odina wodier, or Besharm tree in February and March. Its chrysalis is enveloped in a silky covering, so like that of S. Paphia that it would probably be found to yield a strong and useful thread. It may be worth while to direct attention to the silk spun by several smaller specimens of Bombyx moths, found on different species of Cassia, Acacia and Phyllanthus. A gregarious caterpillar (a species of Lasiocampus) may be observed clustering in great numbers on the stem of the Guava, the Jamoon (Syzygium jambolanum,) and probably other trees: the silky covering of these also seems deserving of examination. Lieut Colonel F. Cotton sent some of the cocoons gathered by him when exploring the Godavery.—*Jury. Reports, Madras Exhibition of* 1855.

Saturnia, this alluded to, is a genus of insects belonging to the order *Lepidoptera* and the family *Bombycidæ*. The antennæ are fringed in the male; the head is small the wings are very broad and entire; the palpi and trunk are wanting.—*Eng. Cyc.*

Saturnia Pavonia minor, the Emperor Moth, is one of the handsomest of the British species of Moths. It is about 3 inches wide. The colour is grayish-brown, faintly tinged with purple; the hinder margin of all the wings has a band of pale brown and purple the hinder band being much waved. The centre of each wing has a large spot or ocellus which is placed on a light ground: it consists of a black pupil, with a yellow or gray iris and partly surrounded by a light blue crescent. The larva is of a green colour having a black band on each segment adorned with pink tubercles bearing a whorl of six hairs diverging like a star. It constructs a curious cocoon, the extremity not being closed, but terminated by a converging circle of very stiff hairs, which enables the insect to make its escape from within but completely prevents all ingress.—*Eng. Cyc.* To the genus *Saturnia* some of the largest of the *Lepidoptera* belong.

Saturnia Atlas, the Giant Atlas Moth, has wings measuring 7 or 8 inches across. This species also with *S. Cecropia* and *S. Luna*, have their wings produced into a tail The cocoons of *S. Cynthia* and *S. Mylitta* are used in India for the production of silk. Latreille states that these are the wild species of silk-worm of China. *S. Cynthia* is the Arrindi Silk Worm of India (Roxburgh, 'Linn. Trans,' vol. vii.) *S. Promethea*, a North American species, forms its cocoon within the leaf of a sassafras-tree, having previously fastened the stalk of the leaf to the stem by a strong silken web, whereby it is prevented from falling with the other leaves (Westwood.)—*Eng. Cyc.* At the Universal Exposition held in Paris, in 1855, samples of Indian silk were exhibited with the cocoons of the different species of the Bombycidæ from the Bombyx Mori. pat Saturnia Mylitta, tussah; Saturnia assamensis, monga; Attacus Cynthia, eri or eriah.—*Rapport du Jury mixte international, page* 54.

(8404) TUSSILAGO FARFARA, *Linn.* Leaves and Flowers of Coltsfoot. Coltsfoot has a creeping root-stock. Leaves, which make their appearance after the flowers, on channeled footstalks, roundish, cordate, angular, sharply toothed, of a glaucous green above, cottony beneath. Flower-heads appear in early spring, of a bright yellow colour, solitary, drooping while in bud, erect when in flower and seed; flower-stalk covered with smooth, scale-like, reddish bracts, many flowered, heterogamous. Florets of the ray female, narrow, ligulate, ray spreading. Florets of the disk male, tubular, with a campanulate 5-cleft limb. Receptacle naked. Involucre of one row of scales, oblong, with membranous margins. Styles of the disk inclosed, abortive; of the ray bifid with taper arms. Achenium of the ray oblong, cylindrical, smooth, of the disk abortive. Pappus of the ray of in many rows, of the disk in one row consisting of very fine setæ.—Chalky soils in England, found in many parts of

Europe, extending to Persia and the Himalayas. St. & Ch.t. 20.

Action. Uses; This plant is mucilaginous and slightly bitter, and may be employed as a demulcent possessed of a little tonic property. It may be prescribed in the form of an Infusion or Decoction (one or two ounces to a pint of water) *ad libitum.—Royle.*

(8405) TUTENAGUE or CHINA SPELTER. This is an alloy of iron, copper and zinc. It is harder than zinc, though less so than iron, sonorous, compact, and has some malleability. The fresh fracture is brilliant, but soon tarnishes. Till superseded by spelter from Silesia it was clandestinely exported in large quantities (more than 50,000 cwt. annually) to India, but is now seldom or never shipped; spelter being on the contrary imported to compete with it in China. For boxes, dishes, household utensils, and other similar purposes, tutenague is well adapted. The art of making it is not known to Europeans. Its export price used to be about 14 dollars a pecul. —*Comp. Desc.*

(8406) TWEEDIA. ASCLEPIACEÆ. Tweedia Cœrulea.—These plants bear blue flowers, and succeed well in a sandy peat soil, and are readily grown from seed.—*Riddell.*

(8407) TYLOPHORA, a genus of plants belonging to the natural order *Asclepiadaceæ*. *T. asthmatica* is very common in the peninsula of India, and called in Telinga 'kaka-palla.' Dr. Roxburgh describes it as being frequently employed there as a substitute for ipecacuanha.—*Eng. Cyc.* Dr. Wight gives figures of Tylophora asthmatica, 1277; carnosa. 351; fasciculata, 248; Iphisia, 1276; mollissima, 1275; parviflora, 1274; and tenuissima, 588.

(8408) TYLOPHORA ASTHMATICA. ASCLEPIAS ASTHMATICA.

Untamol, HIND. | Kaka palla, TAM.

The Cynanchum ipecachuana of Willdenow, by many writers is supposed to be the same as this species, and is common in Bengal. The root is of many long, thick, whitish fleshy fibres, issuing from a small woody head. The dried roots of this article are of very great value, and according to the experience of Drs. Roxburgh and Anderson, confirmed fully by Dr. O'Shaughnessy's own trials, afford an excellent substitute for ipecachuana, if given in rather larger doses.—*O'Shaughnessy, page* 455.

Tylophora Asthmatica, affords a good substitute for flax. It is the Koorinja fibre of Tanjore *prepared* from the Tylophora asthmatica; this is of fine quality, white, strong and silky. The plant grows abundantly in Southern India, and is used medicinally. The Jury of the Madras Exhibition of 1855, considered it deserving of Honorable Mention, as a new discovery. The Koorinja, (*Tylophora Asthmatica*) yields a strong white Silky fibre resembling Flax, a small sample of it was then exhibited by the Tanjore Local Commitee.—*M. E. J. R.*

(8409) TYLOPHORA BARK. UNTAMOL. Bark of root of Tylophora asthmatica must not be confounded with ununtamul, the root of Hemidesmus Indicus.—*Ben. Phar.*

(8410) TYPHA. The genus *Typha* is known by the male and female flowers being uppermost; the stamens are setose, and united by the filaments; the ovarium is surrounded by setæ (*fig.* 4) and the style is persistent. There are three species of this genus, inhabitants of the temperate parts of the globe, and all are found in Great Britain. The name *Typha* is derived from Τφος a marsh, because these plants grow in marshy places. In English they are called Cat's Tail and Reed-Mace, the former from the resemblance of their spikes to the tail of a cat. They are frequently called Bullrushes, but this name is restricted to another genus, the *Scirpus.—Eng. Cyc.*

(8411) TYPHA ANGUSTIFOLIA. Lesser Cat's-Tail or Reed-Mace, has linear leaves grooved below, with the sterile and fertile flowers removed at a little distance from each other. It is less frequent than the last species, but is not uncommon in the neighbourhood of London.—*Eng. Cyc.*

(8412) TYPHA ELEPHANTINA AND TYPHA ANGUSTIFOLIA; Bulrushes, *putera* and *reree*; their leaves are employed in making mats and baskets, in North West India and they are called *pun*. The pollen, like Lycopodium, is inflammable, and is collected in Sind, and there called *Booree.—Royle.*

(8413) TYPHA LATIFOLIA, Great Cat's-Tail or Reed-Mace, has linear nearly plane leaves, with the sterile and fertile flowers continuous. This is a very handsome European aquatic, and grows abundantly in damp marshy places, the leaves three feet in length and an inch in width. When the densely crowded spike is brushed and a lighted candle applied near it, a sudden flash is produced. This arises from the firing of the pollen that is diffused in the air. On the Continent the down of the flowers is used for stuffing pillows, &c. Cattle are fond of the leaves, and the roots are sometimes eaten as a salad. In common with *Sparganium* and *Scirpus* the leaves are used by coopers for filling up the interstices between the wood of their casks; also for making mats, chair-bottoms, baskets, &c. It is this plant which many of the Italian painters have put in the hand of Christ when he was mocked by the Roman soldiers as a king.—*Eng. Cyc.*

(8414) TYPHA MINOR, Dwarf Cat's-Tail or Reed-Mace, has linear-setaceous leaves, with barren and fertile flowers at a great distance. This plant, on the authority of Dillenius, has been placed in the list of British plants. It is found in the south of Germany and Switzerland. Kock calls it *T. minima*. [SPARGANIUM.]—*Eng. Cyc.*

(8415) TYPHACEÆ. Bulrushes.

Pun, Booree, Sindee.

Typhaceæ, *Typhads*, or *Bulrushes*, a natural order of Plants belonging to Lindley's spadicose group of Monocotyledons. The order includes two genera—*Typha* and *Sparganium*. They are herbaceous plants, growing in marshes and ditches, having stems without nodi and perennial rhizomata; the leaves are rigid, ensiform, and with parallel veins; the inflorescence is spicate or capitate, without a spathe; the flowers are unisexual; sepals 3 or more, sometimes merely a bundle of hairs; no petals; the male flowers have 3 or 6 stamens; the female flowers have a single, superior 1-celled ovary; the fruit is dry, 1-celled, and 1-seeded; the embryo is in the centre of the albumen. The species of the two genera are abundant in the northern parts of the world,—*Eng. Cyc.* Bulrushes, so conspicuous in the marshes of Europe, extend also to similar situations in most parts of India. The leaves are in some parts of Europe employed in making mats and winter coverings for plants, as well as for stuffing chairs, the leaves of *putera* and *reree* (or *Typha elephantina* and *T. angustifolia*) are employed in making mats in North-West India. Dr. Stocks informed Dr. Royle that in Sindh the former is called *pun*, and its leaves employed for making mats and baskets. The pollen, like that of Lycopodium, is inflammable, and used as a substitute for it in Europe. It is also collected in Sindh, and there called *booree*.—*Royle Fib. Pl. p.* 35. Bulrushes in Europe are used for putting between the staves of barrels, also for chair bottoms and matting. Typha bread is prepared in Scinde from the pollen of the flowers of the *Typha elephantina*, and in New Zealand from another species of bulrush (*Typha utilis*.)—*Simmonds*.

At the Madras Exhibition of 1855 the Trichinopoly Local Committee exhibited a large collection of figures and Architectural Models, carved in the Pith of the Typha. The attitudes of the figures were stiff but the draparies were characteristic. The figures introduced into the model of the Trichinopoly Fort were out of proportion being far too large, for the scale of the buildings. There were pith Models of Pagodas of Trichinopoly and Salem. Pith work made from the rushes, called "Nultee" in Tanjore. Model of the Pagoda. —*M. E. J. R.*

(8416) TYPHONIUM, a genus of plants belonging to the natural order *Aroideæ*. The spathe is convolute at its base. Spadix interruptedly androgynous below, with rudiments of the sexual organs below the stamens, naked, with a subulate apex. Ovaries with a single ovule, affixed at the base, erect. The species are all stemless herbs, indigenous to India.—*Eng. Cyc.*

(8417) TYPHONIUM ORIXENSE, is described by Dr. Roxburgh by the name of *Arum orixense*, and is common in the shady mango-groves near Samulkota, where the soil is dry and fertile. It is called Ghekool by the natives. Like many other of the *Aroideæ*, this plant is exceedingly acrid.

(8418) TYPHOON.

Ti-fan, Chin.	Bagui, Philippine.
Tufan, Arab.	

This is the European name of the frightful equinoctial gales which vex sea and land about the tropics in the Eastern seas, and down as far as to 10° from the equator. The whole Malayan Archipelago is excluded from their sphere, while the whole of the Philippine is within it, the island of Mindano alone excepted.

U.

(8419) ULMACEÆ, *Elmworts*, a natural order of Exogenous Plants. The flowers are hermaphrodite or polygamous, never in catkins; calyx divided, campanulate, inferior, irregular; stamens definite, inserted into the base of the calyx, erect in æstivation; ovary superior, 2-celled ovules solitary, pendulous; stigmas 2, distinct. Fruit 1-2-celled, indehiscent, membranous or drupaceous. Seed solitary, pendulous; albumen none, or in very small quantity; embryo straight or curved, with foliaceous cotyledons and superior radicle. (Lindley.) This order consists of trees or shrubs, which have scabrous alternate simple deciduous leaves and stipules. The genera belonging to it are *Planera*, *Abelicea*, *Ulmus*, *Celtis*, *Sponia*, and *Mertensia*. The species are natives of the north of Asia, the mountains of India, of north America, China, and Europe. This order is by most botanists made a section of the natural order *Urticaceæ*. It was however separated by Mirbel, and he has been followed by Lindley. They differ from *Urticaceæ* in the possession of a 2-celled fruit and hermaphrodite flowers. In all other respects they resemble *Urticaceæ*, and their affinities are the same. [Urticaceæ]

Most of the species of this order are trees, the timber of which is often very valuable. The bark of the Elm is used as medicine. [Ulmus.] The genera *Planera* and *Celtis*, like the Elm, have species which are handsome ornamental trees, and yield useful timber.—*Eng. Cyc.*

(8420) ULMUS, a genus of Plants, the type of the natural order *Ulmaceæ*. The flowers are small and the leaves are alternate. In most of the species the flowers appear earlier than the leaves; they are disposed in groups, and seated on short peduncles. The calyx is of a reddish colour, distinct from the ovary, imbricated in æstivation, with 4-8 segments, which remain until the fruit falls. The stamens are as numerous as the segments, and are inserted opposite to them. The ovary is elliptical, compressed, cloven at the summit, 2-celled, and 1 ovule in each cell. The fruit is a samara, the wing-like appendage being broad and present all round, except in a notch. Only one of the cells of the ovary develops its seed, so that the fruit is 1-seeded. The embryo has no albumen, and its radicle is straight and uppermost. The leaves are stalked, and unequal at the base, serrated, and generally rough to the touch; the axil of the primary nerves beneath are tufted with fine hairy filaments. The various species of elm are wild in Europe, North America, India and China. Nearly 20 species have been enumerated by various writers, but it is not at all certain that these are true species. This uncertainty arises from the fact which is now generally recognised by the cultivators of the elm, that the seeds of the elm do not produce plants precisely like their parents, and that the amount of difference in the elm is greater than amongst most other species of trees. It is on this account that there are so many recorded varieties of the species which are cultivated for ornament or timber.

(8421) ULMUS ALTERNIFOLIUS AND U. INTEGRIFOLIUS

Thalai, BURM.

Two of the largest trees in the Pegu province; they are found about towns and villages in the Prome district, but not below that latitude. The elms to which family the trees in question belong afford valuable timber,—red-colored wood, strong and adapted for house-building.—*McClelland.*

(8422) ULMUS INTEGRIFOLIUS.

Tambachi marum, also Ayah marum, TAM. | Nullee, TEL.

A large timber tree, a native of Circar mountains, it flowers during the cold season, leaves deciduous about the close of the wet season, they come out again in March. The wood of this tree is reckoned of a good quality by natives and is employed for a variety of uses (*Ross*)—*Rohde M.S.S.* A large sized tree, wood reddish coloured, good for general purposes—said to yield to boiling water a peculiar odour, which when mixed with common arrack gives it the flavour of the more expensive palmira arrack and enables the venders to obtain better prices for their adulterated article.

(8423) ULTRAMARINE.

Bleu d'outremer, FR. | Ultramarin, RUS.
Ultramarin, GER. | Ultramar, SP.
Oltramarino, IT. | Lajvurd, GUZ. HIND.

A very fine blue powder, made from the *Lapis Lazuli* (*Gaz. Hind.* Lajvurd-ka puttur) and highly prized by painters. Owing to the dearness of the *Lapis Lazuli*, this pigment is now artificially imitated in various ways.—*Faulkner.*

(8424) UMBELLIFERÆ, a natural order of Exogenous Plants. This is one of the best marked families of plants, so much so, that Jussieu says the whole order may be looked upon as a genus, and the various sub-divisions and genera as arrangements of the species. All the species are well marked, and have good distinguishing characters, and their inflorescence is always that of the umbel. The possession of an umbel was early made the combining character of this plant by systematic botanists, and they were called *Umbellatæ* on this account. In addition to this distinguishing character, they have also others, as the possession of 5 stamens and 2 stigmas, by which they were all brought under the class *Pentandria* and order *Digynia* of Linnæus. Most of the species are herbs, seldom shrubs, with fistular furrowed stems. The leaves are, in most cases, divided; sometimes they are simple; they are alternate, and all of them embrace or clasp the stem by a sheathing petiole. The flowers are white, pink, yellow, or blue, and are seated on umbels, which are either simple or compound, and these are with or without bracts at their base, which are called involucre, or involucellum, as they surround the umbels, or umbelules. The calyx is superior, either entire or 5-toothed. The petals are 5, and are inserted on the outside of a fleshy disc, which is placed on the top of the ovarium; they are usually inflexed at the point, and have an imbricate, rarely valvate æstivation. The stamens are 5, and are seated alternately with the petals, and are incurved during æstivation. The ovary is inferior, 2-celled, having solitary pendulous ovules, and is crowned by the disc, on which the petals are seated; the styles are two distinct, with simple stigmas. The fruit, which is ordinarily called the seed, consists of 2 carpels, which are united by a common axis, the part by which they unite being called the commissure; the external part of each carpel is traversed by elevated ridges, which are divided into primary and secondary; there are 5 of the latter, and 4, between them, of the former; the ridges are separated by channels, below which are often placed, in the covering of the fruit, little receptacles of coloured oily matter, which are called vittæ. The seed, which is pendulous, usually adheres to the sides of the cell of the fruit, and this has led to the confounding the seed and fruit together. The embryo is minute, and is seated in the midst of a horny albumen, with the radicle pointing to the hilum. The order agrees with *Ranunculaceæ* in its sheathing leaves, as well as its large albumen and its acrid properties. Other relations have been pointed out, as with *Saxifragaceæ*, *Geraniaceæ*,

also with *Araliaceæ*, from which it differs little, except in the number of the parts of the flower. The following conspectus will show the sub-orders and tribes into which numerous genera of this order have been distributed by DeCandolle :—

Umbelliferæ.

- Sub-Order I. *Orthospermeæ*.—Albumen of seed flat on inner surface, neither involute nor convolute.
  - Hydrocotyleæ.
  - Mulineæ,
  - Saniculeæ.
  - Ammineæ.
  - Seselineæ.
  - Angeliceæ.
  - Peucedaneæ.
  - Tordylineæ.
  - Silerineæ.
  - Cumineæ.
  - Thapsieæ.
  - Daucineæ.
- Sub Order II. *Campylospermeæ*.—Albumen rolled inwards at the edges.
  - Eloœoselineæ.
  - Caucalineæ.
  - Scandicineæ.
  - Smyrneæ.
- Sub-Order III. *Cœlospermeæ*,—Albumen curved inwards from base to apex.
  - Coriandreæ.

Tausch has more recently proposed another arrangement, and objected to the albumen being made the basis of the primary divisions of the order. The genera include above 1000 species. These are principally inhabitants of the northern temperate zone, and the greater number of them are found in the Old World. The proportion of species in the southern half of the world, compared with the northern, is as one to four; that of the New to the Old World, as one to three. Very few of the species are found in the tropics, and about 50 are enumerated as inhabitants of Australia. The properties of this order are variable, and very important. One of distinguishing characters of the order is the possession of an acrid principle which finds its development in such plants as the Hemlock [CONIUM], *Œnanthe*, *Helosciadium*, *Æthusa*, &c. This renders the whole order suspicious, more especially, the vegetation, in which the poisonous principle is most developed. The acrid properties of these plants seem to depend upon the possession of a peculiar principle, which in as far as it has been examined in some of the species possesses alkaline properties. This is the case with Conia, a principle obtained from the Hemlock [CONIUM] which has been examined with the most care, although other plants of the order have been found to yield similar principles, but not possessing so much activity. Conia is remarkable amongst the vegetable alkaloids, for being fluid, volatile, and easily decomposed; and it is probable that most plants whose poisonous properties are dissipated by heat possess a principle of a similar nature. In this respect there is also another analogy between the *Umbelliferæ* and *Ranunculaceæ*, the poisonous qualities of the species of the last order being in a great measure annihilated by heat. It is not improbable that all the *Umbelliferæ* may possess a principle similar in nature though not in intensity, to the Conia, and that it may contribute in some measure to render such plants as the parsley, samphire, and celery, desirable as articles of diet. Another important secretion of the *Umbellifer* is a volatile oil. This secretion is found in all the species, with the exception of *Conium*, deposited in the canals of the pericarp, which are called vittæ. In some of the species it is more abundant than in others; and on this account the fruit, which is commonly called the seeds, is used frequently in diet as a condiment, and in medicine as an aromatic and carminative. Of these the carraway, the anise, the dill, the cumin, and coriander are best known. A third secretion of these plants is a gum-resin. This probably, like the last two secretions, is common to the whole order, but is fully developed in only a few species. The gum-resins produced by this order have had a great reputation in medicine, and many of them are still looked on as valuable remedies. The Laser, or Silphion, of the ancients, is secreted by plants belonging to this order, and assafœtida, galbanum, gum-ammoniacum, oppoponax, and sagapenum are much used as stimulant medicines in nervous diseases at the present day. Many of the species when wounded exude in small quantities a gum-resinous matter. A fourth secretion, which also on account of its occasional excess renders this order important to man, is starch. This secretion, which forms so large a portion of the food of animals, is deposited in largest quantities in the roots of the carrot, the parsnep, the skirret, and the artacacha of the South Americans, and on this account these plants are extensively cultivated. Most of the roots however contain this principle, and might be used as articles of diet, but they also contain the poisonous principle of which we have before spoken.

Heat will dissipate this, and some of the roots which are deadly poisonous when raw, it is said, may be eaten with impunity when cooked. The roots of some of these plants resemble that of the horse-radish, and in winter, when the leaves are gone, may be dug up in mistake for it. Fatal consequences have in some cases ensued from such a mistake. Many of the *Umbelliferæ* are much affected in their secretions by climate and cultivation. Thus, the deadly hemlock in Russia is an inert and eatable plant, while the celery of English gardens, if cast on the roadside, becomes, an active poison. The properties of all plants are more or less affected by climate and cultivation; but it is much more obvious where poisonous secretions are increased or diminished, as in the hemlock, or changed, as in the case of the celery. *Jussieu, Dict. des Sciences Naturelles*;

Lindley, *Vegetable Kindom*; Don; Hiller, *Dictionary*; Burnett *Outlines*; Christisen, *Dispensatory* Bischoff, *Lehrbuch der Botanik*.) *Eng. Cyc.*

(8425) UMBER, an Ore of Iron and Manganese, employed as a brown pigment. It occurs massive, amorphous. Structure earthy. Fracture conchoidal. Soft. Opaque. Dull. Meagre to the touch; adheres strongly to the tongue, and falls to pieces in water. Colour blackish, reddish, or yellowish-brown. Specific gravity 2.206. It occurs in beds with brown jasper, in the Isle of Cyprus. It consists of iron, manganese, silica, alumina, and water.

(8426) UMBRELLAS.

Parapluie, FR. | Kettisols (paper umbrellas), CHIN.
Chutree, GUZ. HIND. |

Are well-known articles, employed as a covering against the heat of the sun and rain; a smaller kind, the *parasol* being used chiefly by ladies either while walking, or riding in open conveyances. The *kettisol*, or paper summer head, is extensively manufactured in China, whence it is largely exported to various parts of the world.—*Faulkner.* The Umbrella of the Lepcha in Sikkim consists of a frame work of Bamboo enclosing broad leaves of Phrynium.—*Hooker, Vol.* I, *page* 131. Umbrella, in Malay and Javanese, "paying," and in the latter, also, "songsong." To use an umbrella at all, amongst Malays, or rather to have it carried over one, for no native carries an umbrella himself, is a mark of rank and its quality implies the degree of that rank. The sovereign alone uses one which is gilt throughout. In Java, a small umbrella, called a "bawat," is the special badge of the higher nobility, called by the Sanscrit title of bopati. This is not made use of to screen from sun or rain, but carried by a retainer before the party. —*Crawfurd Dict. p.* 442.

(8427) UNCARIA a genus of Plants belonging to the natural order *Rubiaceæ*. *Uncaria* is sometimes considered only as a sub-genus of *Nauclea*. The flowers are aggregate on a globular receptacle; calyx tubularly urceolate, 5-cleft; corolla funnel-shaped, with a slender tube and naked throat; stamens 5; ovary 2-celled; capsules pedicellate, clavate, attenuated at the base: seeds imbricated, winged; embryo inverse and furnished with a perisperm. The species are chiefly natives of India, but a few are found in America. They are permanent cirriferous ramblers, hanging to different trees by the hooked old peduncles.

(8428) UNCARIA GAMBIER, Roxburgh, the Gambier Plant, is a native of Penang, Sumatra Malacca, &c, The substance called Gambier by the Malays is prepared from it, and it is known in commmerce by the names of *Terra japonica* and Catechu.

This plant was first described by Rumphius, 'Herb. Amb.,' v., p. 63, t. 34, f. 2 and 3, by the name of *Funis uncatus angustifolius*, but the process of preparing the extract was first fully described by Dr. C. Campbell, one of the early medical officers of the station of Bencoolen who paid considerable attention to the useful plants of the neighbourhood. He states that it is chewed by the Malays mingled with betel-leaf and areca-nut in the same way that catechu is used on the continent of India, and was solicitous that a trial should be made of its power in tanning. The preparation he describes as simple:—"The young shoot and leaves are shred and bruised in water for some hours, until a feculum is deposited; this inspissated in the sun to the consistence of a paste, is thrown into moulds of a circular form and in this state the gambier is brought to market."—*Eng. Cyc.*

(8429) UNGKA-ETAM, the Asiatic name for *Hylobates Rafflesii*, Geoffroy. [HYLOBATES.]

(3430) UNGKA-PUTI, an Asiatic name for *Hylobates agilis*. [HYLOBATES]

(8431) UNGUICULATA. Linnæus divided the *Mammalia* into the following sections: —*Unguiculata*, *Ungulata*, and *Mutica*.

(8432) UNKOODOO. NAUCLEA GAMBIER. Hunter.

Unkoodoo kurra, TEL. | Gambier, MALAY.

This is a substance which is sometimes though rarely brought from Malay countries to the Coromandel coast. The Malays chew it with the betel-leaf, as the Indians do the areca-nut. It is prepared from the leaves of the shrub and somewhat resembles catechu. Its taste is exceedingly astringent.—*Ainslie's Mat. Med. p.* 264. The water extract of *Nauclea Gambir*, forms a good leather of a red or orange colour.

(8433) UNONA, a genus belonging to the natural order *Anonaceæ*, so called from 'unus' one, the stamens being united with the germens, The generic character is, slpals 3; petals 6, the 3 inner the smallest; stamens numerous; carpels numerous, one or many celled; seeds in a single row. The species consist of trees, large shrubs or climbing plants, found in hot parts of the world, as India and its islands, Africa, and south America. The bark and fruit of many of the species are aromatic, with some degree of acridity, and are employed as stimulating medicines or as condiments.—*Eng. Cyc.*

(8434) UNONA MUSARIA has been so called from its bark being used for making musical instruments, as is indeed also that of another species. This is a rambling shrub, a native of Amboyna, &c., the roots and bark are also used medicinally. *U. tripetala*, *U. uncinata*. *U. odorata*, &c., natives of the Indian islands, are remarkable for the sweet scent of their flowers. *U. esculenta*, a native of the Indian peninsula, has fruit which is edible. Some species, as *U. sylvatica*, are valued for their timber. *U. longifolia* is an elegant tree, with smooth, pointed, and undulate leaves, which is much cultivated in some parts of India to form avenues and to

afford shade. It is sometimes called Deodara, which is properly the name of the celebrated Himalayan Pine, *Pinus* or *Cedrus Deodara*.—*Eng. Cyc.*

(8435) UNONA NARUM is one of the climbing species, a native of Malabar, which Rheede describes as possessed of medicinal properties, the roots being so used, as well as the sweet-scented greenish-coloured oil obtained from them by distillations.—*Eng. Cyc.* In Malabar, a greenish sweet smelling oil is obtained, by distillation, from the roots of *Unona Narum*, an evergreen climber which is used medicinally as a stimulant.—*Simmonds.*

(8436) UPAS ANTIAR, ANTIARIS TOXICARIA (Leschenault) Ipo toxicaria, *Pers.*

Upas tree, ENG. | Anchar, MALAY.

A native of Java. The juice of this tree is one source of the half fabulous Upas poison. The tree is often over 100 feet in height, its bark pale and smooth, its leaves oval, coriaceous, hairy, juice viscous, bitter, white or yellow, flowing abundantly from incisions, and concreting into a gummy resinous mass. The *Upas antiar* poison is prepared in an earthen vessel with this juice, which is mixed with the seed of the Capsicum frutescens, and various aromatics. This poison at first acts as a purgative and emetic, then as a narcotic, causing death by violent fits of tetanic convulsions. The *Upas tiente* poison is prepared from a strychnos, and differs from this substance.—*O'Shaughnessy, page* 579. Upas, in Javanese, "poison," or "venom," is the sap of some plants of the Malay and Philippine Islands yielding poisonous juices, which, by concentration, produce a poison of considerable activity which has been sometime employed by the ruder natives to render their weapons deadly. The most potent of these plants in Java are the Anchar, the Antiaris toxicaria, a large forest tree and the Cheteak, Strychnos tiente, a climbing shrub. In all these cases, the poison, even when fresh, is far less active than that of the cobra snake, for the most powerful will take an hour to kill a dog, which the venom of the hooded snake would certainly accomplish in half the time. To effect a fatal purpose, too, it is necessary that the poisoned weapon should be left in the wound and not withdrawn, so that the probability is that few human beings have ever lost their lives by means of these poisons.—*Crawfurd, Dictionary, page* 442. The Upas Tree, Antiaris toxicaria, is a poisonous tree grown in Java, in a valley filled with Carbonic acid, highly dangerous therefore to enter.—*O'Shaughnessy.*

(8437) UPUCUTI.

Upucuti, MAL.

Upucuti is the Malabar name of a bush common in Malayalum. It contains a juice which is very tenacious and is used by the Natives for sealing their letters.—*Ains. Mat. Med. page* 204.

(8438) UPUPIDÆ, a family of Insessorial or Perching Birds. Linnæus placed the genus *Upupa* between *Merops* and *Certhia* [CERTHIADÆ], among his *Picæ*, in his last edition of the 'Systema Naturæ:' the species of *Upupa* recorded by him are *U. epops*, *U. promerops*, and *U. paradisea*.—*Eng. Cyc.*

(8439) UPUPA EPOPS, the Hoopoe. This is the "Εποψ of the Greeks (Aristotle, 'Hist. Anim.,' i. 1; ix. 11; ix. 15. 49; Aristophanes, 'Birds.' 228, et seq.; Pausanias, x. 4); Upupa and Epops of the Romans (Pliny, 'Nat. Hist.' x. 29; xxx. 6; Ovid, 'Metam.,' vi.). In Ovid's lines descriptive of the transformation of Tereus, the bird is drawn to the life :—

"*Tereus*, through grief, and haste to be reveng'd,
Shares the like fate, and to a bird is chang'd.
Fix'd on his head the crested plumes appear,
Long is his beak, and sharpen'd as a spear."—*Crexall.*

Two parallel rows of long feathers form an arched crest upon the head; these feathers are of a ruddy buff colour, terminated with black; This bird is found as far north in the summer as Denmark, Sweden, and Russia: and southward in continental Europe, in Germany, Holland, France, Spain, and Italy. It has been seen both at Gibraltar, Ceuta, and in Eygpt (where it breeds): it is probably an inhabitant of the whole of North Africa. It has been also observed at Madeira, and at Trebizond, in Asia Minor, from which last locality it has been sent to England and it is abunbant in India.—*Eng. Cyc.*

(8440) *Epimachus*, Cuv. Bill resembling that of *Promerops*, but the margins are obtuse and somewhat inflected; wings, tongue, and feet unknown; tail very long; side-feathers of the body greatly developed.

(8441) *Epimachus magnus* (*Upupa magna*, Gm., *U. superba*. Lath.). Body generally black or brownish-black; tail graduated, thrice as long as the body (Lesson says three feet in length, French); feathers of the sides elongated, raised, curled, glittering on their edges with steel-blue, azure. and emerald-green, like precious stones; the head and the belly lustrous also with steel-blue, &c. In truth, language fails to convey any just idea of the magnificence of this species. It inhabits the coasts of New Guinea.—*Eng. Cyc.*

(8442) URANIA, a genus of Plants belonging to the natural order *Musaceæ*. The name which the plant bears in Madagascar is Ravenala. This genus has but one species, *U. speciosa*, which is a native of Madagascar. It has a superior coloured perianth, consisting of 3 petals; a 2-leaved nectary, and one of the leaves bifid; a 3-celled many-seeded capsule, and the seeds in two rows covered with an aril. The flowers are arranged upon a spadix, which are nodding,

very similar to the bananas which belong to the same family. The leaves are arranged in a fan-shape. The seeds of this plant are said to constitute a wholesome food.—*Eng. Cyc.*

(8443) URANIA SPECIOSA. MUSACEÆ. HANDSOME URANIA. The yard of a Burmese merchant in Tavoy, is often visited by Europeans to look at what is deemed the most curious tree in the Provinces. It is frequently amusing to listen to the observations of the spectators that may not unfrequently be seen gathered around it on a fine evening. "It is a kind of a palm," says one, "do you not see that its trunk is precisely that of a palm?" This settles the question so long as the eyes are kept on the trunk; but another looks up and cries out, "No such thing! Look at its leaves. They cannot be distinguished from the leaves of a plantain tree." It belongs to the natural family of the plantain, but it has the trunk of a palm, and the leaves are not arranged around the stem like those of the plantain, but in two opposite rows, so that the whole head has the form of a gigantic fan. It is the only tree of the species that Mr. Mason has seen on the Coast, and it was brought up by its owner from Penang. It is well worthy of cultivation for a curiosity.—*Mason.* The Plantain Leafed Palm is an elegant tree, a native of Madagascar: spreads its leaves out like an open fan, forming a semicircular head. It has a short solid trunk, with leaves like a plantain; and in a border, or at the end of a walk, when growing, forms a perfect screen: its peculiar appearance strikes a person immediately when seen for the first time. It bears a small fruit like the drupe of a plantain, which is of a blueish colour. Roxburgh says—"The plant has the property of rendering water or milk, either hot or cold, mucilaginous, without altering the taste, colour, or smell, of the liquid in its former state." Butter-milk and water is often thickened with the juice of this plant and then sold as an unadulterated article of the richest and best description. Is propagated by seed and suckers. Fifteen feet space should be allowed between each tree.—*Riddell.*

(8444) URCEOLA. A genus of Plants belonging to the natural order *Apocynaceæ*, so named by Dr. Roxburgh from urceolus, 'a pitcher,' in consequence of the form of its corolla. The genus *Urceola* is confined to the Malayan peninsula and the islands of Sumatra and Penang; but as it is by some botanists considered not to differ from the *Vahea* of Madagascar, the genus may have a wider distribution. It has the calyx small, 5-partite. Corolla urceolate; tube elongated, ventricose, 5 cleft. Stamens 5, anthers sagittate. Follicles 2; numerous, glabrous.—*Eng. Cyc.*

(8445) URCEOLA ELASTICA, or Caoutchouc-Vine, is shrubby and twining, climbing over trees to a great extent, sometimes as much as 200 paces; with oval opposite leaves, and terminal panicles. From wounds made in the bark of this plant there oozes out a milky fluid, which on exposure to the open air separates into an elastic coagulum, and watery liquid apparently of no use. After the separation takes place. This coagulum is not only like American Caoutchouc, or Indian-Rubber, but possesses all the same properties as first ascertained by Dr. Roxburgh ('Asiat. Res,' v. 171.) He states that a ball of it externally has the appearance of American Caoutchouc; when cut into, it is of a light brown colour, till the action of the air darkens it. This ball, measuring 9½ inches in circumference, and weighing 7¼ ounces in simply falling from a height of 15 feet, rebounded about 10 or 12 times, which is of itself an indication of the goodness of the Caoutchouc. Dr. Roxburgh also found that slips of it were capable of bearing a greater degree of extension and contraction than the American. When they broke, the elasticity was so great, that each end returned to its respective mass. The least pressure with the finger and thumb united different portions as perfectly as if they had never been separated: this property of Caoutchouc has been considered a much more modern discovery. [INDIAN RUBBER.]—*Eng. Cyc.* A plant grows in the forests, east of Chittagong, the milk of which flows in a continuous stream resembling caoutchouc (it is probably the *Urceola elastica*, which yields Indian-rubber.)—*Hooker. Him. Jour. Vol.* II. *page* 350. *Urceola Elastica.* Roxb. As. Res. v. 169. Sumatra and Pulo Penang. A large woody climber, yields caoutchouc of the finest quality, in great abundance.—*O'Shaughnessy, page* 449.

(8446) URENA, a genus of Plants belonging to the natural order *Malvaceæ*. Like other Malvaceous plants, the species of *Urena* abound in strong and serviceable flax-like fibres, which are well fitted for conversion into cordage. *U. lobata* and *U. sinuata* are specially mentioned as employed for this purpose in India.—*Eng. Cyc.*

(8447) URENA LOBATA. URENA HEMP.

Bun-ochra, BENG. HIND.

This weed, which abounds all over the Tenasserim Coast, serves in the place of hemp in Amherst Province and appears to afford a valuable article.—*Mason.*

(8448) URENA LOBATA. BUN-OCHRA.

Wet-khyœ-pa-nai, also, Kat-sai-nai, BURM.

A weed, common in most parts of India, abounds in a strong fibre, which is a tolerably fine substitute for flax. The Urena lobata abounds along the [illegible] of province Amherst; and affords a valuable hemp.—*Mason.*

This *Fibrous Plant* is also an annual, flowering in December, but though in other respects resembling *Triumfetta*, the flower is of a light pinkish colour, and the capsules are a little larger

than those of Triumfetta lobata and differ still more in their presenting from three to five grooves, marking the detriscence, or the number of valves or parts of which the capsule is composed; but in other respects the two plants appear alike to ordinary observation, and alike also as to the value of their fibre. They are both generally found growing together, and are two of the most plentiful weeds which are to be found in Pegu. They take possession of all ground recently cleared of tree jungle about Rangoon, and extend without interruption to the Pegu and Tounghoo districts, but become scarce or only occasionally met with in the Prome and Tharawaddy districts. —*McClelland.* Both of the above are common in most parts of India, the bark yields a strong and tolerably fine substitute for flax. Roxb. III. 182.—*Rhode M. S. S.*

(8449) URENA SINUATA.

Uren, Rheede.	Kangooga, Beng. and Hind.
Palia mankena, Tel.	
Kungia, Hind.	

A weed common in most parts of India; abounds in strong fibre, a tolerably fine substitute for flox —*Royle.*

(8450) URGUJJA, a yellowish coloured perfume, made of several scented ingredients, sandal wood, wood aloes, rose water, atter of roses, civet cat perfume, and oil of Jessamine. -*Herklots.*

(8451) URJUNA BARK. A stringent bark of Terminalia alata.—*Beng. Ph. p.* 229.

(8452) URTICA (from 'uro'), a genus of Plants known under the common name of Nettle. Nettle is the same word as the anglo-Saxon 'netel' or 'nædl,' a needle, which is applied to these plants on account of their possessing small bristles or prickles which have a stinging property. This genus is the type of the natural order *Urticaceæ*. The flowers are either monœcious or dicœcious. The staminiferous flowers have a single perianth of 4 leaves, containing the rudiment of a pistil. The pistilliferous flowers have a single perianth of 2 leaves; a sessile stigma, and a dry fruit containing a single seed. Most of the species are herbaceous plants or under shrubs, and are found in Europe, Asia, and America. Three of the species, of which there are about 40, are British. The woody fibres of other species of *Urtica* are employed in making linen. The *U.* (*Bochemeria*) *nivea* yields a remarkable fine fibre, with which delicate fabrics are made in India.—*Eng. Cyc.*

On the island of Chusan, there is a species of Urtica. Both wild and cultivated, which grows about three or four feet in height, and produces a strong fibre in the bark, which is prepared by the natives and sold for the purpose of making ropes and cables.—*Fortune.*

(8453) URTICA ARGENTEA, a nettle of the Society Islands, the fibres of which are converted into cord: and of U. Japonica in Japan, its bark is made into lines, cordage and cloth. See "China Grass, Caloee."

(8454) URTICA CRENULATA. Roxb. Oman Putta, or Surat, a gigantic stinging nettle, a native of the hills and valleys on the east of Bengal; Luckipore, Pundua Hills and Assam. This nettle affords a quantity of fine white fibre of great strength, and not durable. The Hill tribes fabricate it into coarse cloths —*Royle Fib. Pl.* It grows in the Calcutta Botanic Gardens, it stings so terribly that it has sometimes occasioned very formidable sypmtoms. Another urtica, the *Daoun setan*, or demon nettle of Timor, is still more dangerous in its effects.—*O'Shaughnessy, page* 578. Where the ground is swampy, dwarf *Bandanus* abounds, with the gigantic nettle, *Urtica crenulata* ("Mealeem-ma" of Sikkim,)—*Hooker. Him. Jour. Vol* II *p.* 339. This plant is a native of the hills and valleys on the east of Bengal. Dr. Roxburgh obtained it first near Luckipore. It has since been found near the Pundua Hills. Major Hannay enumerates it among the fibrous plants of Assam. It has an erect shrubby stem, with oblong acute leaves, having the margins crenulate or slightly dentate, both sides alike, the bark armed with acute burning hairs. The sting produces great pain, extending to the armpit; abates after two or three days, but does not disappear entirely for nine days. Major Hannay says of this and another, which he enumerates as Nos. 3 and 4, and calls gigantic stinging Nettles, that they afford a quantity of fine white fibre, but apparently of no great strength, and, by report, not very lasting. Some of the Hill tribes use the fibre for fabricating coarse cloths.—*Royle Fb. Pl. p.* 66.

(8455) URTICA HETFROPHYLLA. Neilgherry nettles, Horoo Surat at Assam.

Herpha or Serpah, Bhootea.	Theng Mah, Chin.

Is the most widely diffused of the large Indian Nettles, being found in south Concan, along the Malabar Coast; the Mysore, the Neilgherries the valleys of the Himalayas; in Assam, and Burmah: It is an annual plant, the sting of which produces intense pain. The bark abounds in fine, white, glossy silk like fibres, but these probably differ with the locality in which the plant is grown, Dr. Wight describes that of the Neilgherries, as a fine soft flax like fibre, and fitted to compete with flax for the manufacture of even very fine textile fabrics. The Todavers extract it by boiling the plant, and use it as a material for making thread. Mr. Dickson passed it through his machine and liquid, which rendered it like a beautiful, soft, silky kind of flax. He calls it a wonderful fibre, of which the two would be useful for mixing with wool, as has been done with the China grass.

The *Horoo Surat* of Assam, said to be the *Urtica heterophylla* of Dr. Roxburgh, is the most widely diffused of the large Indian Nettles,

inasmuch as it is found in the Southern Concan, on the Malabar coast, and specimens of fibre of what was called *Neilgherry Nettle*, produced by *Urtica heterophylla.* were sent by Dr. Wight to the Exhibition of 1851. It is also found in Burmah and in Assam ; and along the foot of the hills extends to the Deyra Doon. It may be seen even in the northern valleys of the Himalayas. It is an annual, with erect angular stems, marked with small white specks, in which are inserted stiff, most acute bristles. The leaves are long, petioled, caudate at the base, variously lobed, and towards the top of the plant almost palmate; all are grossly serrate, armed with the same bristles as the stem and branches, from four to eight inches long and nearly as broad. Dr. Roxburgh says of it, that it is the most ferocious looking plant he has seen, and it acts up to its appearance : the least touch of any part producing most acute pain, but fortunately of short duration. The bark abounds in fine, white, glossy, silk like, strong fibre. Major Hannay says of it, that it is the *Horoo Surat* of the Assamese, and known to the Bhoteeas as the *Serpah* or *Herpah*,—that the fibre is extensively used by them in the manufacture of cloth. It was recognized by the Chinese as the *Theng Mah*, and said to be prized for the softness of its fibre, as well as for its strength. As the seeds are quick of vegetation, the cultivation of this plant, can be carried to any extent. The fibre of this Nettle, sent from the Neilgherries, is very long soft, white, and silky, and has been much admired by many of the best judges of fibres. The specimens were sent by Dr. Wight, and prepared in a rude way by boiling by the Todawars of the Neilgherry Mountains. Dr. Wight says of it, that " it produces a beautifully fine and soft flax-like fibre, which the Todawars use as a thread material, and if well prepared fitted to compete with Flax for the manufacture of very fine textile fabrics." This fibre could of course be equally well prepared in a multitude of other places, some near, others distant from the sea. Mr Marshall did not consider it well suited for his purpose. At Dundee, it was thought a very good fibre, but rather dry. Mr. Dickson, who has passed it through his machine and liquid, has rendered it like a beautiful, soft, silky kind of Flax, and calls it a wonderful fibre, of which the tow would be useful for mixing with wool, as has been done with the China-grass, and the fibre used for the finest purposes. If this should be proved to be the case on trial, it might no doubt be produced abundantly, and, with some improved process of separation, very cheaply, at easily accessible places on the Western Coast of the Indian Peninsula.—*Royle Fib. Plants, p.* 67.

The *Fibre of the Neilgherry Nettle* is supposed to be still unknown in commerce. As yet it is only obtainable in small quantity, but if called for the supply might be largely increased as the plant is abundant and widely distributed over the Indian Peninsula. It is separated by boiling the stalks.—*M.C.C.* With regard to the strength of the Nettle fibres, it has already been stated that Dr. Roxburgh found the Rami or caloee bore 240 lb., when Hemp bore 158 lb., and sunn 150 lb v. Table, Messrs. Sharpe, in 1815, found a cord bore 252 lb., when Russian Hemp was only required to bear 82 lb.; So in Dr. Royle's experiments with these fibres in an untwisted state, Petersburgh Hemp bore only 160 lb., when China-grass bore 250 lb., the Rheea 320 lb., and the Wild Rheea 343 lb., Mr. Henley had previously found the Kunkhoora or Rheea to bear about three times the weight of Russian Hemp. The Urticaceæ is a family of plants which prefer localities where there is considerable moisture of soil or climate. They grow to a gigantic size in the hot moist parts of Asia, and extend from its warm tropical islands, all along the Malayan Peninsula, along the foot and in the vallies of the Himalayas, near to the Sutlege, many of the species and genera have long been famous for the tenacity of their fibre. See CHINA-GRASS : BOEHMERIA.—*Royle.*

(8456) URTICACEÆ. Some of the fibres in the Sikkim Himmalaya of the various nettles ; are twisted for bowstrings, others as thread for sewing and weaving ; while many are eaten raw and in soups especially the numerous little succulent species.—*Hooker. Him. Jour. Vol.* I. *p.* 293.

(8457)URTICA INTERRUPTA.URTICACEÆ. This Nettle, a large annual plant, grows during the rains. The whole plant is covered with stinging hairs, like the common nettle. It grows wild : there are several indigenous species. —*Riddell.*

(8458) URTICA NIVEA is abundantly grown in the western part of one province and in the adjoining province of Kiangse. Fabrics of various degrees of fineness are made from this fibre and sold in these provinces, but Fortune had not seen any so fine as that made about Canton : it is also spun into thread for sewing purposes, and is found to be very strong and durable. There are two very distinct varieties of this plant common in Chekiang—one the cultivated, the other the wild. The cultivated variety has larger leaves than the other ; on the upper side they are of a lighter green, and on the under they are much more downy. The stems also are lighter in colour, and the whole plant has a silky feel about it which the wild one wants. The wild variety grows plentifully on sloping banks, on city walls, and other old and ruinous buildings. It is not prized by the natives, who say its fibre is not so fine, and more broken and confused in its struc-

ture than the other kind. The cultivated kind yields three crops a year. The last great crop which he observed was that of a species of juncus, the stems of which are woven into beautiful mats, used by the natives for sleeping upon, for covering the floors of rooms and for many other useful purposes. This is cultivated in water, somewhat like the rice-plant, and is therefore always planted in the lowest part of these valleys. At the time of his visit, in the beginning of July, the harvest of this crop had just commenced, and hundreds of the natives were busily employed in drying it. The river's banks, uncultivated land, the dry gravelly bed of the river, and every other available spot was taken up with this operation. At grey dawn of morning the sheaves or bundles were taken out of temporary sheds, erected for the purpose of keeping off the rain and dew, and shaken thinly over the surface of the ground. In the afternoon, before the sun had sunk very low in the horizon, it was gathered up again into sheaves and placed under cover for the night. A watch was then set in each of the sheds; for however quiet and harmless the people in these parts are, there is no lack of thieves who are very honest if they have no opportunity to steal. And so the process of winnowing went on day by day until the whole of the moisture was dried out of the reeds. They were then bound up firmly in round bundles, and either sold in the markets of the country, or taken to Ningpoo and other towns where the manufacture of mats is carried on on a large scale.—*Fortune.*

Hemp is cultivated in the provinces north of the Meiling, but the plant also grows in Fuhkien; the grasscloth made from it is not so much used for common dresses as cotton and silk. There are three Chinese plants which produce a fibre made into cloth known under this name, viz., the *Cannabis sativa* or hemp at Canton, the *Urtica nivea*, a species of nettle grown about Sucham, and the *Sida tiliæfolia* near Tientsinfu.—*Williams' Middle Kingdom, page* 106.

(8459) URTICA PULCHERRIMA. The Hill Nettle. Affords very fair samples of fibre. The plant from which this fibre is taken is deserving notice. It yields the latter long in staple and of considerable strength. On the Neilgherry Hills it is known and appreciated by both Todawers and Berghers.—*M. E. J. R.*

(8460) URTICA TENACISSIMA, like some of the other nettles, as well as the hop and the hemp, belonging to the same natural family, abounds in ligneous fibre, which may be converted into very strong cordage. This is the Caloee of Marsden, Rami of the Malays, a native of Sumatra, also of Rungpore, where it is called Kunkamis, and which Dr. Roxburgh found one of the strongest of all the vegetable fibres which he subjected to experiment. Nettle Hemp, viz., the *Urtica tenacissma*, Burmese "*Goun*" is diffused in the Neighbourhood of Ava.

It was cultivated for several years by Major Macfarquhar at Tavoy, who endeavoured to induce the natives to foster it, but it has not yet been brought into general culture. Colonel Burney said that the Burmese at Ava called it goun. —*Mason.*

(8461) URTICA VIRULENTA. a nettle occurring near Gurhwal and Simla abounding in fibre.

(8462) URTICACEÆ, *Nettles* or *Nettleworts*, a natural order of Plants. The plants belonging to this order are trees, shrubs, and herbs, yielding in some instances a milky juice. The leaves are alternate, and usually covered with asperities or with hairs furnished with a stinging secretion; the stipules are membranaceous, and are deciduous or convolute in vernation. The flowers are monœcious or diœcious, either scattered or collected together in catkins or in close heads. The calyx is membranous, lobed, or persistent. The stamens are definite in number, not united, and inserted into the calyx opposite its lobes; the anthers during æstivation are curved inwards, but are turned backwards with elasticity after bursting. The ovary is superior, containing a solitary erect or suspended ovule with a simple stigma. The fruit is either a simple indehiscent nut, surrounded by a membranous or fleshy calyx, as in *Boehmeria*; or it is a fleshy receptacle, either covered by numerous nuts lying among the persistent fleshy calyxes, as in *Dorsteina*, or the nuts are inclosed in the cavity of the receptacle, as in the Common Fig; or it may consist of a single nut covered by a succulent involucre. The embryo is straight, curved, or spiral sometimes without albumen; the cotyledons are flat, and the radicle points to the hilum. The order, as thus defined, includes several groups of plants which are frequently separated, as the *Artocarpeæ* of Robert Brown, the *Batideæ* of Martius, and the *Moreæ* of Endlicher. This order brings together plants growing all over the world, possessing very different properties, and yielding very various and useful products. The Stinging Nettles [Urtica] form the type of the order. To it belongs also the deadly Upas. [Antiaris.] The wholesome Fig, the celebrated Banyan, and species yielding deadly poisons belong to the genus *Ficus*. [Ficus.] The Bitter Hop [Humulus], the Acid Mulberry [Morus], and the Narcotic Hemp [Cannabis], and famous Cow-Tree [Cow-Tree], all belong here. The sap of many of the species, especially those belonging to the division *Artocarpeæ* is milky. [Artocarpaceæ; Moraceæ; Artocarpus; Bœhmeria; Dorstenia.]—*Eng. Cyc.*

(8463) USNEA, a genus of Plants belonging to the natural order of Lichens. The *Usnea*

plicata, in common with the *Roccella tinctoria* and other Lichens, is used as a dye.—*Eng. Cyc.*

(8464) UVARIA GRANDIFLORA ? UVARIA FRUIT. This fruit has the taste and appearance of the North America pawpaw, and they are members of the same natural family. It is the produce of a scandent shrub abounding in the Tenasserim jungles.—*Mason.*

(8465) UVARIA ODORATA. ANONACEÆ. Sweet scented Uvaria. A small tree, flowers white, delightfully fragrant, introduced from China. Native cottages on the Tenasserim Coast are often overshadowed by the sweet uvaria, whose yellow-green petals almost blend their colouring with that of the leaves.—*Mason.*

(8466) UVARIA TOMENTOSA. A tree, the fruit of which is about the size of a Nutmeg; flowers of purple colour, and hang in clusters.—*Riddell.*

V.

(8467) VACCINACEÆ, *Cranberries*, a natural order of Exogenous Plants. The species of this order are shrubby plants, with round irregularly angled stems and branches; simple entire alternate coriaceous leaves, with a solitary or racemose inflorescence. The calyx is superior and entire, or with 4, 5, or 6 lobes, sometimes deciduous. The corolla is monopetalous, and its lobes correspond to those of the calyx, and are alternated with them. The stamens are free, and are generally double the number of the lobes of the calyx, and are inserted into an epigynous disc; the anthers are terminal, 2-celled, bursting by pores, and furnished with two horns. The ovary is inferior, surrounded by the epigynous disc, 4-5-celled, with one or many seeds in each cell; the style and stigma are both simple. The seeds are very small, with a straight embryo in the midst of a fleshy albumen; the cotyledons are very short, and the radicle is long. This order is made by many botanists a section of *Ericaceæ*. It differs from *Ericaceæ* in possessing an inferior ovary and a succulent fruit. It was placed by Richard in *Escalloniaceæ*, but it differs from this order in being monopetalous.—*Eng. Cyc.*

(8468) VACCINIUM, a genus of plants, the type of the natural order *Vaccinaceæ*. This genus consists of shrubby plants with alternate membraneous leaves, often beset with resinous dots, and are either permanent or deciduous. The flowers are seated on pedicels, and are either solitary or arranged in simple racemes, generally drooping, without any odour, and tainted with various shades of red or pink. The calyx is 4-5 toothed; the corolla urceolate or campanulate, more or less deeply 4-5 cleft, with the limb reflexed; the stamens are 8 or 10 not attached to the corolla, with 2-horned anthers dehiscing at the summits, and sometimes furnished at the back with two spreading spurs or bristles; the style is longer than the stamens, and the stigma obtuse; the fruit is a berry, globose, depressed at the tope, 4- or 5-celled, many-seeded, of a black purple, bluish, or red colour, generally eatable though not always plessant or wholesome in an uncooked state. The genus consists of about 50 species, which are known by the common names of Bilberries, Whortleberries, Bleaberries, &c.—*Eng Cyc.* Dr. Wight in Icones gives Vaccinium, 1179; affine, 1190; arboreum, 1188; Donnianum, 1191; Dunalianum, 1194; Griffithianum, 1192; hirsutum, 1182; Leschenaultii, 1188; Malacca, 1186; Neilgherrense, 1189; obovatum. 1193; odontocerum, 1187; serpens, 1183; serratum, 1184-6; setigera, 1181: venosum, 1185; verticillatum, 1181; Wallichianum, 1180.

(8469) VACHELLIA, a genus of Plants belonging to the natural order *Leguminosæ*. *V. Farnesiana*, a native of the East and West Indies, exudes from its bark a considerable quantity of gum. The flowers when distilled yield a delicious perfume.—*Eng. Cyc.*

(8470) VACHELLIA FARNESIANA. Mimosa Farnesiana, Roxburgh.)

Veda vully marin, TAM.	Urimeda, SANS.
Jali mara, CAN.	Gooya.babula, HIND.

Flowers very fragrant.—*O'Shaughnessy, page* 303. An armed shrub, very common in Mysore and Dekhan, exuding much gum like the babool, which it greatly resembles in its timber, the size is very small.—*M. E. J. R.*

This pretty, tall shrub is sometimes called gum arabic tree in Calcutta, though not the true gum arabic plant, it is a favourite with the natives on the Tenasserim Coast, and it grows rapidly from seeds. The flowers are deep yellow, small, in globular heads, like the mimosa, and powerfully fragrant.—*Mason.* The true gum-arabic tree is not in the Tenasserim Provinces, but the vachellia-tree produces a gum with all the properties of the gum-arabic of commerce; and the cashew-tree, which grows all over the Provinces, "annually exudes," says Voigt, "from 5—12 pound weight, of a fine white transparent gum, like gum arabic, and not inferior to it in virtue or quality." —*Mason.* The wood is deficient in size, in other respects good.—*Rohde.*

(8471) VAGHEY, the Tamil name of a Ceylon tree which grows to about twelve inches in diameter. It is a strong wood, and is used by the natives for wheels of carts, &c.—*Edye Ceylon.*

(8472) VAHEA GUMMIFERA, of Madagascar, yields caoutchouc.—*O'Shaughnessy, page* 449.

(8473) VALERIANA, a genus of plants, the type of the natural order *Valerianaceæ*. The species of this genus are herbs or undershrubs, with very variable leaves, and mostly reddish-white corymbose flowers. The limb of the calyx is involute during flowering, but it at last unfolds itself in the form of a feathery pappus, which is seated on the inferior ovary; the corolla is infundibuliform, gibbous at the base, and 5-cleft; the stamens are 3, and the fruit is indehiscent, 1-celled, and 1-seeded. This genus presents many diversities of form, although its species are obviously closely related —*Eng. Cyc.* Wight gives Valeriana Arnottiana, 1045-6: Brunoniana, 1045; *Hookeriana*, 1045; and Leschenaultii, 1044.

(8474) VALERIANA JATAMANSI. INDIAN VALERIAN.

Balchur, HIND.

Valeriana Jatamansi, the Jatamansi valerian of the Himalayas is an efficient substitute for the European article, and is a very useful stimulant and antispasmodic remedy chiefly employed in hysteric cases. Dose, one to two ounces three times daily.—*Beng. Phar. p.* 305. See SPIKENARD; also NARDOSTACHYS.

(8475) VALERIANACEÆ, Valerian Worts, a natural order of Exogenous Plants, belonging to Lindley's Aggregose group of Monopetalous Exogens. The order is composed of annual or perennial herbs or undershrubs with opposite stipulate leaves. All the perennial species have roots more or less strongly scented, the annual are mostly inodorous. The flowers are either corymbose, panicled, or in heads, sometimes changing from one form into the other; the calyx is superior, the limb either membranous or forming a feathery pappus; the corolla is tubular 3-6-lobed regular or irregular and sometimes spurred at the base; the stamens vary in number from 1 to 5 and are inserted into the tube of the corolla alternately with its lobes; the ovary is inferior and 1-celled, with sometimes 2 imperfected and aborted cells, the ovule is solitary and pendulous: the style simple and from 1 to 3 stigmas; the embryos straight and without albumen with a superior radicle. These plants are most nearly allied to Dipsaceæ from which they are distinguished by their looser inflorescence, sensible properties, want of Albumen and the absence of an involucellum. They are remotely related to Rubiaceæ. They are natives of temperate climates or elevated positions in both the Old and new World. They are more abundant in the North of Asia Europe and South America than in Africa or North America. Valerianella; Spikenard. Nardostachys.—*Eng. Cyc. page* 1179.

(8476) VALLARIS, a genus of Plants belonging to the natural order *Apocynaceæ*. The species consist of a few twining shrubs, which are found in China, the Indian Islands, and the plains of India. Of these *V. Pergulana*, called *Echites hircosa* by Roxburgh, and common in the Indian Peninsula and Archipelago, is remarkable for its offensive goat-like smell; while *V. dichotoma*, indigenous in the North-Western Provinces, is remarkable for its agreeable odour. Its leaves are employed there as poultices.—*Eng. Cyc.* Wight gives, Vallaris dichotoma, 438; and Pergularia, 429.

(8477) VALLEY, LILY OF THE, a common name for the *Convallaria majalis*. The genus *Convallaria* has a bell-shaped 6-parted deciduous perianth; a 3-celled 2-ovalled ovary; a blunt trigonous stigma; berry with 1-seeded cells; flowers jointed to the pedicel.—*Eng. Cyc.*

(8478) *Convallaria majalis*, the Lily of the Valley, is about a foot high, with two ovate, lanceolate radical leaves. The flowers are racemose, nodding, pure white, globose, bell-shaped, and fragrant.—*Eng. Cyc.*

(8479) VALLISNERIA, a genus of Plants belonging to the natural order *Hydrocharaceæ*. The species of this genus are all water-plants. They are dicœcious: the male flowers are seated on a spadix; the corolla is monopetalous with three segments. The female flowers are included singly in a spathe, and are seated upon a spiral peduncle; the calyx is composed of a single leaf; the corolla is polypetalous; the capsules are 1-celled, many-seeded; the seeds parietal. Several species of *Vallisneria* have been recorded in Europe, Australia, and America. The economy of these plants is exceedingly interesting in a physiologieal point of view. They are plants growing at the bottom of the water, and yet the male and female flowers are separated, and the mode by which they are brought together affords a singular instance of adaption. These plants generally grow in running waters, and thus render the difficulty of the contact of their flowers greater. This is effected by the elongated peduncles of the pistilliferous flowers reaching the surface of the water when the staminiferous flowers are floating along. The *V. spiralis* is found in Italy, in ditches near Pisa, and in the Rhone. There are two Australian species, and also an American and East Indian species. The latter is the *Hydrillus* of Dr. Hamilton, and is used in Hindustan, under the name of Jangi, for the purpose of supplying water mechanically to sugar during the process of refining.—*Eng. Cyc.*

(8480) VALONIA consists of the acorn-cups of *Quercus Ægilops*, or prickly cupped oak,

growing in the Morea. As soon as the acorns are gathered, they are dried and conveyed by mules to Symrna for shipment. They are here stored in warehouses for some months in layers from 8 to 5 feet in thickness. The cups undergo a slight fermentation, and in drying, the long spreading scales which confined the acorn contract, and allow the acorn to fall from the cup. The acorns which contain no tannin are separated from the cups, and those of the latter which are damaged are also picked out. The diameter of the cups including the scales is little under 2 inches. A small kind of valonia, *camata*, bears a higher price than the common : it is somewhat richer in tannin, and is chiefly used by the silk dyers. Good valonia is thick, full grown, and bright in colour. If exposed to rain after being gathered the cups lose a portion of their tannin and become of a deeper colour. About 2 lbs. of valonia are required for the production of 1 lb. of leather, which is said to be less permeable to water than that made with oak-bark, and so heavy as to make valonia the cheapest of all tanning materials, except catechu or terra. A mixture of valonia and oak-bark may be used with good effect.

(8481) VAMPIRE. The common Vampire-Bat. [CHEIROPTERA.]

(8482) VANANGU. The Tamil name of a Ceylon tree which grows to about eighteen inches in diameter, and twelve feet in height. It is used by the native carpenters in house-work, &c; and produces a fruit which the natives eat.—*Edye, Ceylon.*

(8483) VANDA, a genus of plants, the type of the tribe *Vandeæ*, of the natural order *Orchidaceæ* Wight gives Vanda pulchella, 1671 Roxburghii, 916 spathulata, 915 Wightiana, ? 1670.

(8484) VANDA CŒRULIA. Writing of this plant Dr. Hooker says that near the village of Lernai on the Jyntea Hills, oak woods are passed, in which *Vauda cœrulea* grows in profusion, waving its panicles of azure flowers in the wind. As this beautiful orchid is at present attracting great attention, from its high price, beauty, and difficulty of culture, Dr. Hooker points out how totally at variance with its native habits is the cultivation thought necessary for it in England. The dry grassy hills which it inhabits are elevated 3000 to 4000 feet: the trees are small gnarled, and very sparingly leafy, so that the Vanda which grows on their limbs is fully exposed to sun, rain, and wind. There is no moss or lichen on the branches with the Vanda, whose roots sprawl over the dry rough bark. The atmosphere is on the whole humid, and extremely so during the rains; but there is no head, or stagnation of the air, and at the flowering season the temperature ranges between 60° and 80°, there is much sunshine, and both air and bark are dry during the day : in July and August, during the rains, the temperature is a little higher than above, but in winter it falls much lower, and hoar-frost forms on the ground. Now this winter's cold, summer's heat, and autumn's drought, and above all, this constant free exposure to fresh air and the winds of heaven, are what of all things we avoid exposing our orchids to in England. It is under these conditions, however, that all the finer Indian *Orchideæ* grow, of which we found *Dendrobium, Farmeri, Dalhousianum, Devonianum* &c., with *Vanda cœrulea*, whilst the most beautiful species of *Cœlogyne, Cymbidium, Bolbophyllum*, and *Cypripedium*, inhabit cool climates at elevations above 4000 feet in Khassia and as high as 6000 to 7000 in Sikkim. We collected seven men's loads of this superb plant the Vanda cœrulia for the Royal Gardens at Kew ; but owing to unavoidable accidents and difficulties, few specimens reached England alive. A gentlemen who sent his gardener with us to be shown the locality, was more successful : he forwarded one man's load to England on commission, and though it arrived in a very poor state, it sold for 300*l.* the individual plants fetching prices varying from 3*l.* to 10*l.* Had all arrived alive, they would have cleared 1000*l.* An active collector, with the facilities I possessed, might easily clear from 2000*l* to 3000*l.*, in one season, by the sale of Khasia orchids.—*Hooker Him. Jour* : *p.* 321.

(8485) VANDELLIA CRUSTACEA, is given in Wight's Icones.

(8486) VANDELLA DIFFUSA, a native of Brazil, thought to be found also in the peninsula of India. It is the Caaetaica of Pison, and described by Dr. Hancock as emetic, and its decoction as useful in fevers and liver complaints. —*Eng. Cyc. Vandellia diffusa* of the Isle of France, Brazil, and Yuagana, is considered of great value as an emetic and febrifuge, and in the treatment of dysentery.—*O'Sh. p.* 477.

(8487) VANGUERIA, a genus of Plants belonging to the natural order *Rubiaceæ*. The species are few in number of which the principal are *V. edulis* of Madagascar, and the Indian *V. spinosa*. Both species form small trees or shrubs, having ovate or oblong petiolate leaves, with lanceolate stipules, solitary on both sides. The fruit of *V. edulis* is eaten by the natives of Madagascar and of Mauritius, where it has been introduced, as well as into the peninsula of India. *V. spinosa*, the Mayna of the natives of Bengal, but which is found in many parts of the plains of India, is a distinct species, though united to the above by Sprengel in his ' Syst. Vegetabilium.' It is said to be also found in China. The fruit is eaten by the natives of India.—*Eng. Cyc.*

(8488) VANELLUS. [CHARADRIADÆ.]

(8489) VANGA. [LANIADÆ.]

(8490) VANGUERIA SPINOSA. THORNY VANGUERIA.

Bungaree kee lakree, also Mayna Mainphul, HIND. | Pedda munga, TEL.

Grows in the Kotah and Mewar jungles; the dried berries are given to cattle, and the fresh berries are sometimes eaten by the inhabitants.—*Genl. Med. Top. p.* 182.

(8491) VANILLA, a genus of Plants, the type of Lindley's natural order *Vanillaceæ*. The name is derived from 'vaynilla,' a diminutive of 'vayna,' which in Spanish signifies a knife or scissor-case, the fruit being long and cylindrical, and like the sheath of a knife. The species are generally supposed to be confined to Brazil, Guyana, and the West Indies, but several have been described by Schiede from Mexico. Species have also been found in Penang, Singapore and Java. The species of this genus are climbing plants, but are not epiphytic, as many of the *Orchidaceæ*, although in climbing up trees they put forth roots as holdfasts, which are capable of absorbing nutriment for the plant when other modes of supply are cut off. The leaves are fleshy, subcordate at the base, and articulated with the stem; the stem is square, and frequently climbs to a height of 20 or 30 feet; flowers are fleshy; the perianthium is articulated with the ovarium, and frequently caliculated; the sepals and petals are nearly equal, conformed and three at the base; the labellum is entire, connate with the column, concave and barbed in the middle; the column is elongated and apterous; the anthers are terminal and opercular; the pollen-masses are two bilobed and granulose; the fruit is siliquiform, fleshy, and dehiscing at the side; the placentæ, from 3-6, covered with seeds; the seeds are globose, and covered with a closely adnate testa. Lindley enumerates eight species as belonging to this genus, two of which have been found in Asia and six in America. The fruits of most of them are aromatic, and on this account have formed a considerable article of commerce from their consumption as luxury.—*Eng. Cyc.* Wight gives Vanilla aphylla, 931; Walkeriæ, 632; *Wightii*, 931.

(8492) VANILLA AROMATICA. Aromatic Vanilla, has ovate-oblong acuminate sessile leaves; perianth companulate, with five undulated acuminated laciniæ; the labellum acuminate, cucullate at the base, with an elevated naked middle line. This species is the *Epidendrum Vanilla* of Linnæus, and is a native of Brazil, and was supposed at one time to yield all the vanilla of commerce. Under this name have been included two or three species of *Vanilla*, one of which is probably the only species that yields vanilla. The vanilla which is added to chocolate, custards, and many kinds of confectionary to give them a pleasant flavour is the produce of V. aromatica.—*Eng. Cyc.*

(8493) VANILLA. sp. Dr. Falconer discovered, while on his visit to the Tenasserim Provinces in 1849, a new species of vanilla, but its specific name and description have not yet transpired. —*Mason.*

(8494) VARANIDÆ, *Varanians*, a family of Lizards, designated by Messrs. Dumeril and Bibron as Platynote or Broad-Backed Saurians and thus characterised by them:—Body very much elongated, round, and without a dorsal crest, supported on strong legs and feet, with distinct and very long but unequal toes. Tail slightly compressed, at least twice longer than the trunk. Skin furnished with enchased scales, which are tuberculous, pojecting, rounded upon the head as well as upon the back and sides, always distributed in rings or circular bands, paralled under the belly and round the tail. Tongue protractile, fleshy, similar to that of the serpents that is to say capable of elongation and of being withdrawn into a sheath, narrow, and flattened at the base, and deeply divided and separated into two points which can be divaricated as in the Ophidians. Linnæus arranged these Saurians under the great genus *Lacerta*. Daudin separated the larger portion of the species under the generic appellation of *Tupinambis*. Dr. J. E. Gray, in his 'Synopsis' (1827), arranged under his family *Varanidæ* the genera *Varanus* and *Draceæna* of Merrem, which he very well characterised. No such family as the *Varanidæ* appears in Dr. Gray's Table, published in the British Museum Synopsis (1842), and the British Museum Catalogue (1845); but the *Monitoridæ* (which are the first family of the *Leptoglossæ*, the first group of his *Sauria*) consist of the genera *Psammosaurus*, *Monitor*, *Polydædalus*, *Empagusia*, and *Hydrosaurus*. [MONITORIDÆ.] Next to the *Crocodilidæ*, the *Varanidæ* attain the greatest size of any of the Saurians; indeed Herodotos, Ælian, and others regarded them as terrestrial crocodiles. The *Varanidæ* are divisible into two distinct groups: the eminently terrestrial group, whose abode is far from the waters, in desert and sandy places; and the aquatic group, consisting of those which inhabit the banks of rivers and lakes. America claims one only,—that on which the genus *Heloderma* is founded. In Asia there are four *Varani* properly so called; three in Africa; and four in Oceania. Of these four, two have been observed in Australia, one in the isles of the Papuan Archipelago, and the fourth in the Isle of Timor. —*Eng. Cyc.*

(8495) VARNISH. A varnish is a solution of a resin or of a gum-resin in a liquid, which being spread over a surface, evaporates, and leaves the solid in the form of a brilliant, transparent film. The principal substances used in varnishes are the following:—

Solvents.	Solids.	Colours.
Oil of Nuts.	Amber. Elemi	Gamboge. Annotto.
„ Linseed.	Anime.	Dragon's blood. Red Saunders
„ Turpentine.	Copal. Benzoin	Aloes. Cochineal.
„ Rosemary.	Lac Colophony	Saffron. Indigo.
Alcohol. Ether.	Sandarach. Arcanson.	Tumeric.
Wood-naphtha or pyroligneous ether.	Mastic.	
	Damar.	
	Common resin.	

The resins, or as the Varnish-maker calls them, *gums*, may be used either singly or combined, and the same remark applies to the solvents. One of the most desirable qualities in a varnish is durability, a quality which depends greatly on the comparative insolubility of the resin employed, its hardness, toughness, and permanence of colour.

Amber is most distinguished in these respects: it resists the action of ordinary solvents, and reqnires to be fused at a high temperature, for making varnish: it is hard, and moderately tough, and its colour is scarcely acted on by the air. The objections to amber are its costliness and the length of time required for amber-varnish to dry; it does not become full hard under many weeks. [See Amber]

Anime is imported from the East Indies in chests weighing from 3 to 5 cwt. Those which contain the palest and largest gum fetch the highest price. It should be scraped by hand before being sold, but a good deal of it is *pickled* that is, cleaned from its rust-like colour, by being steeped for several days in a strong alkali, well washed with a broom and then rinsed with water. This kind sells for about one-third less than that which has been scraped with a knife. The varnish maker picks out the large, pale, transparent pieces, or they are sold separately as *body-gum*; the next best in quality is separated from the third and worst quality which is used for gold-size or japan-black. Anime is almost as insoluble and hard as amber, but not so tough: the varnish made with it dries quickly, but is liable to crack, and the colour deepens by exposure to air and light. Anime is largely used in oil varnishes, and there is a large proportion of it in *copal varnishes* on account of its drying quickly.

Copal is produced in India, America, the West Indies, Sierra Leone &c. Dr. Lindley says that "the copal of Madagascar, and probably of the East Indies generally, is furnished by *Hymenæa verrucosa*," that "*Vateria Indica* furnishes the resin called in India *copal*, (in England known by the name of *gum animi*,) and very nearly approaching the true resin of that name: in its recent and fluid state it is used as a varnish, (called *Piney* varnish,) in the south of India, and, dissolved by heat, in closed vessels, is employed for the same purpose in other parts of India; it is extremely tenacious and solid, but melts at a temperature of 97½° Fahr. Dr. Wight tells us that the natives obtain it by the simple process of cutting a notch in a tree, sloping inwards and downwards: the resin collects there, and soon hardens. ["The Vegetable Kingdom," 1846. On the Malabar coast, this resin, under the name of *Piney Dammar*, is made into candles, "which diffuse in burning an agreeable fragrance, give a clear bright light with little smoke, and consume the the wick so as not to require snuffing. Some of these candles that were sent home were highly prized and sold for very high prices." (*Wight.*) Their importation was stopped by the high duties that were levied on them.] Copal is generally imported in lumps about the size of small potatoes, of as slightly yellow tint, and often including insects and animal remains. It is often covered with a clay-like substance, from which it is freed by the dealers by scraping. The finest and palest lumps are selected for what is called *body*-gum; the next best form *carriage-gum*, and the remainder being freed from wood and stones, forms what is called *third*, or *worst quality*, and is used for gold-size or japan-black. Copal has a conchoidal fracture; it is transparent, inodorous, and tasteless. Its density varies from 1.045 to 1.139. It softens by heat without becoming viscid, and at a higher temperature fuses, partly decomposes, and gives off an aromatic odour. Copal is next in durablity to amber: the pale specimens, when made into varnish, become lighter by exposure. It is an excellent material for varnishes, and attempts have been made to use it as the basis of a spirit varnish; it is, however, so little soluble in alcohol, that when boiled therein, only a small portion dissolves, and the remainder swells and softens. It is said, however, that by reducing copal to an impalpable powder, and exposing it for about 12 months to the action of the air, it becomes soluble in alcohol, and may be used for preparing varnishes. The addition of a small quantity of camphor increases the solubility of copal in alcohol; the same effect is produced by fusing it, setting it on fire, and allowing it to burn a few minutes: these, and similar plants, however produce a very inferior varnish. Oil of rosemary is said to be one of the best solvents of copal: ether is probably the best solvent, but it evaporates so rapidly that the varnish cannot be spread equally. The oils of spruce and lavender have also been used as solvents. The three resins, amber, anime, and copal, either separately or mixed in certain proportions, are converted into varnish by fusion and the addition of linseed-oil heated nearly to its boiling point: the combination of the resin and the oil is promoted by stirring and boiling, and the required degree of fluidity in the varnish is attained by the addition of oil of turpentine. These are the most important of the *oil varnishes*;

they are the most durable, they are hard enough to bear polishing, and they possess considerable brilliancy They are used for works of the best quality, such as are exposed to the weather or to much friction, as coaches, japan-work, and house decorations.

Lac and *sandarach* form the basis of *spirit varnishes*; these resins are more soluble than amber, anime and copal; they are dissolved in spirit of wine, or pyroligneous spirit, which is cheaper. In France, where alcohol is very cheap and abundant, spirit varnishes are largely employed. [Dumas, in the seventh volume of his "Traite de Chimie," has a large collection of recipes for spirit varnishes.] They are used for cabinet and painted works not exposed to the weather. [See LAC—SANDARACH.] Lac is harder than sandarach, and is the basis of most lackers [see LACKER], and also of French polish [see FRENCH POLISH]. Sandarach is used for making a pale varnish for light-coloured woods: it may be hardened by the addition of shell-lac or of mastic if required to be kept pale; and when required to be polished, Venice turpentine is added to give it body.

Mastic is a soft resin: dissolved in spirits of wine or oil of turpentine it makes a very pale varnish: it is brilliant, works easily, and flows better on the surface than most other varnishes. It can also be removed by friction with the hand, hence its use as a picture varnish and for other delicate works. See MASTIC.

Damar is softer than mastic: it forms an almost colourless varnish with turpentine: mixed with mastic it forms a moderately hard, flexible, and almost colourless varnish adapted for maps and similar purposes.

Common resin, dissolved with the assistance of heat in turpentine or linseed oil, makes a hard, brittle, brilliant varnish, which is employed for common purposes, as in house painting, toys, cabinet work, &c. It improves the brilliancy of other varnishes, but renders them brittle unless used sparingly.

The *linseed oil*, used as the vehicle for the harder resins, should be pure, pale, well clarified, and combined with the resin at as low a temperature as possible. Unless these conditions be attended to, a dark varnish is produced which becomes darker by age. This oil gives softness and toughness to the resin, but produces a slowly drying varnish. It is clarified for the best varnishes by being gradually raised to near the boiling point in a copper pan. Fig. 2221.

Turpentine is in extensive use for varnishes, either as a vehicle for the resins or for thinning oil varnishes, in which case it is used hot The turpentine should be of the best quality, clean and limpid; it is greatly improved by age, and should be kept for months or even years. Turpentine varnishes are cheap and flexible; they dry more quickly than oil varnishes, and are of a lighter colour, but not so tough or durable. Mastic, damar, and common resin may be dissolved in oil of turpentine either cold or at a gentle heat.

Alcohol or *spirits of wine* is used as the vehicle for sandarach and shell-lac, as in the *white* and *brown hard spirit varnishes*. Spirit varnishes dry more quickly, harder and more brilliant than those made with turpentine. The spirit must contain very little water or it will not dissolve the resins; and in applying the varnishes a moderately moist atmosphere is sufficient to occasion such a precipitation of the resins as to produce a dull, cloudy, or milky effect on the varnished surface: in which case the varnish is said to be *chilled*. The varnish-maker ascertains whether the spirit is strong enough by steeping a piece of writing paper in it and setting it on fire; if the flame consume the paper the spirit is judged to be sufficiently strong; if not, it contains too much water.

Naphtha or pyroligneous ether is objectionable on account of its smell, but is used for cheap varnishes. It dissolves the resins more readily than ordinary spirit of wine, but the varnish is not so brilliant.

Copal varnish for fine paintings, &c.—Fuse 8lbs. of the cleanest pale Africa gum-copal, and when completely run fluid, pour in 2 gallons of hot oil: let it boil until it strings strongly; and in about 15 minutes, while still very hot pour in 3 gallons of turpentine obtained from the top of the cistern. There may be much loss of turpentine during the mixing, but the varnish will be so much the brighter, transparent, and fluid, and will work freer, dry quickly, and be very solid and durable when dry. If the varnish be too thick after being strained, hot turpentine is to be added before the varnish is quite cold.

Artist's virgin copal.—From a select parcel of scraped African gum-copal, before it is broken, pick out the very fine transparent pieces, which appear round and pale like drops of crystal; break these very small; dry them in the sun, or by a very gentle fire. When cool, bruise, or pound them into a coarse powder. Next, boil some broken bottles or flint glass in soft water and soda, and pound the glass into a coarse powder; boil it again, strain off the water, and wash it in 3 or 4 waters, that it may be perfectly free from grease, dry it before the fire, or in an oven. Mix 2 lbs. of powdered glass with 3 lbs. of powdered copal; put them into the gum-pot and fuse the gum, stirring all the time: the glass will prevent the gum from adhering together, so that a very moderate fire is sufficient to fuse the gum. When the gum is sufficiently run, pour in 3 quarts of very hot clarified oil. Let the varnish boil until it strings freely between the fingers. Mix it rather hotter than if it were body-varnish, for, as there is but a small quantity, it will be sooner cold. Pour in 5 quarts of old turpentine, strain it immediately,

and pour it into an open jar or large glass bottle; expose it to the air and light, but keep it from the sun and moisture until it is of sufficient age for use.

Cabinet varnish.—Fuse 7lbs. of very fine African gum-copal, and, when well run, pour in half a gallon of pale, clarified oil: when clear, mix it with 3 gallons of turpentine, and strain. This, if properly boiled, will dry in 10 minutes; but if boiled too strongly it will not mix with the turpentine; and sometimes, when boiled with the turpentine, it will mix, but will not combine with any other varnish that has been less boiled than itself. This varnish is used by japanners, cabinet, and coach painters. Animé is however generally used for cabinet varnish.

Best body copal varnish, for the body parts of coaches and other objects intended for polishing, is made by fusing 8 lbs. of fine African gum-copal, and adding 2 gallons of clarified oil. It must be boiled very slowly for 4 or 5 hours until quite stringy, and be mixed off with 3½ gallons of turpentine.

The foregoing varnishes are made of the finest copal without the addition of driers; they are the palest and best of their kind, and have great fluidity and pliability. They are, however, slow in drying, and it requires months for them to become hard enough to polish well. If the varnish is not required to be very pale, gum of second quality is used, and if required to dry quickly, sugar of lead or white copperas, singly or together, are used in the proportion of ½ lb. to 1lb. to each of the quantities given in the recipes; but the brilliancy, colour, and durability of varnishes are injured by the introduction of driers. If the varnish be required to dry and harden quickly without the use of driers, anime may be used instead of copal, but it does not form so durable a varnish, and it becomes darker by age. Anime varnish may be mixed with copal varnish in certain proportions, while both are hot. A moderately quick drying body-varnish may be made by mixing 1 part of anime with 2 parts of copal; for an inferior varnish, drying more quickly, 2 parts of anime to 1 part of copal may be mixed.

Carriage varnish for the wheels and under frame-works of coaches and other objects not requiring to be polished is made like common body-varnish, only that to 8lbs. of gum of second quality are used about 2½ gallons of oil and 5½ gallons of turpentine, with driers. This varnish is boiled until it becomes very stringy. Its quality is intermediate between body-varnish and

Wainscot varnish, which is made of 8 lbs. of animé of second quality, 3 gals. of clarified oil, ¼ lb. of litharge, ½ lb. of sugar of lead, ¼ lb. of copperas. These ingredients must be well boiled until the varnish strings very strong, and it must be mixed with 5½ gals. of turpentine. This varnish, which dries quickly, is used chiefly for house painting and japanning. It may be darkened by the addition of a small quantity of gold size.

Spirit and *turpentine* varnishes are prepared by mixing the resins and the solvent together, and agitating the whole with a stick with a number of pegs or nails driven in near the lower end until the solution is complete. The resins should be dry, and in small pieces, with the impurities picked out: the finest and clearest pieces of the gum are set aside for superior varnishes. Turpentine varnishes are made in quantities of 10 or 12 gallons: spirit varnishes from 4 to 8 gallons. In making the latter, the ingredients are sometimes put into a cask of 8 or 16 gallons' capacity, and mounted so as to revolve upon bearings at the ends. An alternating motion is given to the barrel by passing round it a cord terminating in a cross handle. When the operator pulls this cord towards him the barrel rotates, and winds the cord up in the other direction so as to be ready for a second pull, which, in like manner, winds the cord in the opposite direction, and so on. Agitation must be kept up, or the resin will agglutinate. After 3 or 4 hours, or when the solution is complete, the varnish is left for a few hours to deposit solid impurities, and is then strained through muslin or lawn into bottles. Coarsely pounded glass is sometimes added to prevent the agglutination of the resin. When heat is employed in making spirit-varnishes, the source of heat should be a water or a sand bath, and a still and worm may be used to prevent loss by evaporation, the resins and solvent in the still being kept in motion by a stirrer passing through a stuffing-box in the head. Shell-lac contains a little wax, which is apt to get diffused through the varnish when heat is applied. The inflammable nature of the ingredients will of course suggest the necessity for caution in making spirit-varnishes. The utensils employed must be quite clean and dry.

Best white hard spirit varnish, such as will bear polishing, is made by adding 2 lbs. of the best picked gum-sandarach to 1 gallon of spirits of wine, and agitating for 4 hours, until the solution is complete. 18 ozs. of Venice-turpentine, (or 9 ozs. if the work is not to be polished,) are to be moderately heated in a water-bath until quite fluid, and added to the varnish to give it body. Agitate for an hour, strain and put into bottles, which must be kept well corked. After remaining undisturbed for a week, the varnish is fit for use. If the clearest and palest pieces of gum be selected, this varnish will be pale enough for white work.

White hard varnish.—(No. I.) 3½ lbs of gum-sandarach to 1 gallon of spirits of wine, and when the solution is complete add 1 pint of pale turpentine-varnish, and shake the whole well together. (No. 2.) 2lbs. of gum-sandarach, 1 lb. of gum-mastic, and 1 gallon

of spirits of wine. *White spirit-varnish for violins.*—2 lbs. of mastic to 1 gallon of spirits of wine and 1 pint of turpentine-varnish.

Brown hard spirit varnish is similar to white hard varnish, only shell-lac is used instead of sandarach. Dissolve 9 lbs. of shell-lac in 1 gallon of spirits of wine, and then add 18 ozs. of Venice-turpentine, warmed. This varnish will bear polishing. Or, 2 lbs. of shell-lac, 1 lb. of sandarach, and 2 ozs. of mastic dissolved in 1 gallon of spirits of wine. A lighter colour is produced with 2 lbs. of sandarach, 1 lb. of shell-lac, and 1 gallon of spirit. When the solution is complete add a pint of turpentine-varnish, and agitate the whole well together. If a pale lac-varnish be required, *white* or *bleached lac* may be used. Lac-varnish may be bleached by Mr. Leming's process :—"Dissolve 5 ozs. of shell-lac in a quart of rectified spirits of wine ; boil for a few minutes with 10 ozs. of well-burnt and recently heated animal charcoal, when a small quantity of the solution should be drawn off and filtered ; if not colourless, a little more charcoal must be added. When all colour is removed, press the liquor through silk, as linen absorbs more varnish, and afterwards filter it through fine blotting-paper." [Transactions of the Society of Arts, vol. xlv. In the same volume is a recipe by Mr. G. Field for bleaching lac-varnish by means of chlorine. Dr. Hare has also published a method as follows: —" Dissolve in an iron kettle 1 part of pearlash in about 8 parts of water, add one part of shell or seed-lac, and heat the whole to ebullition. When the lac is dissolved cool the solution and impregnate it with chlorine gas till the lac is all precipitated. The precipitate is white, but the colour deepens by washing and consolidation ; dissolved in alcohol, lac bleached by this process yields a varnish which is as free from colour as any copal varnish." The application of the chlorine must be made by a person acquainted with chemistry. Hence chloride of lime is safer as a bleaching agent, the lime being afterwards dissolved out from the precipitate by the addition of muriatic acid. The precipitate is to be washed several times, dried and dissolved in alcohol with the addition of a little mastic. This varnish is very pale, but rather thin. When copal is added to spirit-varnishes in order to increase their toughness and durability (although the advantage of adding copal may be questioned), the copal should be in fine powder, the spirit very strong, and a gentle heat of about 120°, with frequent agitation, should be used. A light-coloured varnish may be made with ¼lb. of shell-lac, ¼lb. of copal, to 1 gallon of strong spirit.—*Tomlinson.*

(8496) VARNISHED WARE OF THE BURMESE. The process of making this ware has been minutely described by Major Burney, who witnessed every branch of the manufacture at Amrapura, and the museum of the Asiatic Society in London contains several specimens of various kinds, as well as a set of cups in every state from the first weaving of a few strips of bamboo to the complete formation of an elegant article of domestic economy. A description of each specimen will best explain the whole process. The first is a wooden frame of wood covered with strips of bamboo woven together so as to form a basket, which is the frame work of the intended cup ; the weaving is like that of a lady's work basket, and care is taken, that it shall be as thin and light as possible, as upon this matter the beauty and delicacy of the ware will depend ; towards the edges, the weaving is of a coarser nature, and the bamboo is made as fine as hair.

2 The basket is covered on the outside with varnish laid on with a brush, made of the husk of the cocoanut. The varnish is the essential part of the manufacture, without which nothing can be done, it is named thit-tsi (wood oil) and is procured from a tree of which there are extensive forests in the northern parts of the Burmese empire. The varnish may be gathered at all times but if taken during the flowering season which is at the beginning of the year, it does not harden well. It appears to be in many of its properties analogous to China varnish, and it affects in a similar way the health of those who prepare it : not apparently to such a degree as in China, but still enough to be very unpleasant to those unaccustomed to it who frequently find their hands blistered and their arms and faces swelled with its effects. All who use it take certain precaution against accidently swallowing any portion and they are careful to touch it with the right hand only while they take their food with the left. Some persons are more seriously affected by the varnish than others and its injurious effects appear in blotches so much resembling leprosy that the other Burmese refuse to hold intercourse with the affected person. The varnish as before remarked, is laid on with a brush, to spare the hand as far as practicable: but in all future operations on the same vessel it is laid on with the hand both in order to procure a fine surface and to enable the workman to discover and reject the minutest particles of dust. When first laid on, the varnish looks of a light brown colour, but rubbing with the hand turns it to a fine black. When the cup is varnished, it must be carefully shut up in a box to exclude the dust, and then deposited in a deep cold vault. This is said to be essential to its proper setting and with one of which every manufactory is provided. The cup is kept in the vault at least three days.

3 The third cup is advanced another step towards completion, it is covered over with a thick black paste which is intended to stop up all holes in the baskets and to give the ware a

body. Different pastes are used for this purpose but all agree in being composed of some fine powder mixed up with thit-tsi, in one sort, the powder is that of calcined bones; in another the fine saw dust of teak wood; in all cases the paste is dabbed on with the fingers, so as to hide the basket as far as the workman is able to do. The specimen under description looks black and rough, and the basket appears in several places through the paste, after this process as well as after every other in which the varnish is used in any shape, the cup is returned to its concealments in the vault, where it must remain at least three days before any subsequent operation can be proceeded.

4 The next specimen is the cup ground smooth inside. The operation is performed in a clumsy lathe, one of which is in the Asiatic Society's museum, it is more like the roller on which a jack towel is hung behind a kitchen door than the instrument we call a lathe. This roller is turned backwards and forwards with a stick and leather string like the drill bow of our workmen, and a hollow cylinder. The workman inserts the rough cup, and if it is not large enough to stick tight in it, he fixes it there by slips of bamboo, he then smears the inside of the cup with water mixed with an ochrey red earth, turns the lathe rapidly with his right hand, and presses a piece of pumice stone held in his left hand, against the inside of the cup, this process soon rubs down the rough surface of the paste, and is continued until it is quite smooth. The specimen is smooth on the inside the paste is rubbed down quite level with the basket work which appears through it, but without injury to the smooth surface. The outside of the basket is unaltered.

5 The fifth cup has undergone precisely the same operation on the outside, the only differences in the manipulation being that the cup was fastened upon a form or chuck, so as to leave the outside open to the workman, instead of being put into a basket to expose the inside.

6 This cup is covered on the inside with an additional quantity of paste of finer quality which was laid on by the workman after the outside was ground smooth, and dried in order that it might receive an additional polish on a subsequent day.

7 This specimen is covered with fine paste on the outside as well as on the inside. Its appearance is rough and black. In this stage the cup has been ground outside and in, and has also received a coat of fine varnish. This is the result of the two successive operations with the interval of at least three days between them, the grinding is performed on the lathe, as in No. 4 and 5 but instead of pumice stone, the workman employs first a piece of smooth sandstone then a rag with charcoal and water, and lastly a piece of moist cloth. The cup is dried well in the sun before the varnish is laid on, which is done with the finger.

8 This cup has received a second coat of varnish and is quite black and glossy, but not even on the surface. Thus far all the Burmese ware goes through the same processes whatever may be the style in which they are to be finished, whether black or red, plain or figured. The remaining specimens show the various modes, in which the manufactures furnish off their work, according to their own state or that of their employers.

9 The next cup is simply polished in the lathe, this is performed by turning first against a piece of smooth stone as in No 7 then by moistened rice husks, held in the hollow of the left hand against the cup while turning; thirdly by a rag dipped in well pulverised teak wood, and lastly by the hand smeared with a peculiar polishing powder, said to be made of the petrified wood of a tree. The ware thus furnished is like the black japaned ware used in Britain.

10 The ware in this specimen is red like sealing wax, not so fine as British red japanned ware, but still clear and bright. The colour is manufactured at Ava, and is said to be superior to the best Chinese vermillion, it is moistened with an oil called shazi, extracted from the *kunyen* (*Dipterocarpus turbinatus*) and then mixed ed with thit-tsi varnish. The mixture is laid upon the cup, after it has gone through the two first operations of No. 9 and nothing more is required than giving it a polish with the hand unless extraordinary lustre is desired when a mixture of shauzy and thit-tsi is applied.

Specimens 11 and 12 are engraved cups executed in the Shan or Siamese style. The engraving is done with great ingenuity and rapidity, although the only tool is a needle tied to a stick and whetted on a bit of slate. The artist holds the cup on his knees with his left hand and keeps his graver almost motionless in his right, he then dexterously turns the cup by the help of his knees to meet the graver. The Shan style consists in engraving a piece of black ware as No. 9 and filling up the hollows with vermilion, if any figures are represented they are left in relief, in the manner of wood engraving. Some grotesque figures done in this way are seen in number 12. In specimen No. 11 the hollows are not yet filled in, and the cup has a greyish appearance, arising from the light brown lines left by the graver in the polished black varnish. The vermillion is laid on as in No. 10, and after drying several days is rubbed off in the lathe with wet bran held in the hollow of the hand. The operation is generally repeated to ensure a complete filling up of all hollows and the cup is afterwards varnished and polished.

A more expeditious method called the Burman style, consists in engraving upon a red cup left as in No. 10 and filling up the hollows

with different colours, usually yellow or green, specimen 13 is engraved with grotesque Chinese looking figures, and 14 is a similar one with the lines filled with yellow or primrose, The engraving is first prepared by being varnished over, the colour is immediately rubbed in with the finger until it is quite dry, when the cup is finished sometimes a small quantity of indigo is mixed with the orpiment, which produces a green colour, several articles in the Society's museum are very finely executed in this way, some of which have both colours in the same specimen. The beauty of the engraving consists chiefly in the contrast of bright colours, and the regular interlacing of minute lines in which some specimens resemble our engine turning ; taste or drawing is totally out of the question.—*Rohde. M. S. S.*

There are other modes of preparing the varnished ware : the finer sorts are sometimes, finished with gilding or with raised figures or mouldings. These are formed of the teak wood paste mentioned in specimen 3 which is pressed when soft, into tin moulds and when dry it becomes as hard as the wood of which it was originally made. Europeans have found this paste an excellent material for making the raised work on picture frames and similar objects. Some articles are diversified by leaving portions of the basket work uncovered by the varnish, in this case the weaving is of the finest quality, and the open parts being of different patterns the effect is very good. Larger works are made of wood, joined together with teak paste, and afterwards covered in the same way as the basketwork, the only difference between the process being, that in the wood work, the first varnishing is omitted, the solid and flat surface of the wood taking the paste at once without preparation. —*Rhode M. S. S.*

(8497) VARNISHED WARE OF CHINA. RHUS VERNIX or VERNICIA, CHINESE VARNISH TREE. When Mr. Fortune prepared to take up his late residence in China, his attention was directed by the Calcutta Agricultural Society, to the Chinese varnish tree, *Rhus* species, the wax insect tree, *Fraxinus* species, and to the soap bean tree, *Cæsalpinia* species : to the various trees valuable for their fruit or timber and ornamental plants ; but above all to the green indigo (so called), *Rhamnus* species, which yielded a dye that was at that time attracting much attention in France. He says, the tree which yields the Chinese varnish is a species of Rhus which although producing an article of great value is extremely dangerous to use. The varnish is largely used in the country for giving a fine polish to tables and chairs used in the houses of the wealthy. The beautiful lacquer ware so extensively exported from Canton to foreign countries, and which is so well known and justly admired, is produced by this tree. It has the valuable property of being less liable than French polish to be injured by a heated vessel which may be placed upon it, but it is very poisonous and requires to be handled with great care by the workmen who use it. Indeed after furniture is dry it is very unsafe for certain constitutions until it has been in use for some time and the smell entirely gone. A friend of his Mr. Jones, American Consul at Foochowfoo, used some furniture which had been laquered some time and was apparently quite dry and yet he was very ill for a long time from its effects so ill that he thought he should be obliged to leave the country and go home. And this is no solitary instance, for he has known several persons suffer most severely from the same cause. —*Fortune's Residence, p.* 146. Williams, however, says the beautiful appearance of the lacquered-ware of China owes its lustrous coloring to a composition of lampblack and the clarified juice obtained from a species of sumach, called *Rhus Vernix* or *Vernicia*. Wood oils are obtained from other plants of the same family, and the different qualities of lacquered-ware are owing to the use of these inferior ingredients. The real varnish tree is described by De Guignes as resembling the ash in its foliage and bark, it is about fifteen feet in height, and furnishes the sap when seven years old, which is carefully collected from incisions in the trunk opened in the summer nights. The body of the ware is wood partially smoothed, or pasteboard, upon which two or three coats of a composition of lime, paper, and gum are first laid and thoroughly dried and rubbed. The surface of the wood is also hardened by rubbing coarse clay upon it, and afterwards scraping it off when dry. Two coatings of lamp black and wood oil, or in the finer articles, of lamp black and varnish, are laid upon the prepared wood, and after drying, the clear varnish is brushed on, one coating after another, with the utmost care, in close and darkened rooms, allowing it to dry well between the several coats. The articles are then laid by to be painted and gilded according to the fancy of customers, after which a last coating is given them. The varnish is brought to market in brownish cakes, and reduced to its proper fluidity by boiling ; it is applied to many purposes of both a varnish and paint, when it is commonly mixed with a red or brown color. A beautiful fabric of lacquered-ware is made by inlaying the nacre of fresh and saltwater shells in a rough mosaic of flowers, animals &c. into the composition and then varnishing it. Another kind, highly prized by the Chinese, is made by covering the wood with a coating of red varnish three or four lines in thickness, and then carving figures upon it in relief. The great labour necessary to produce this ware renders it expensive. A common substitute for the true varnish is the oils of the Dryandra, Jatropha, Croton, and other members of the

Euphorbiaceous family, expressed from their seeds by a variety of simple machines, consisting for the most part of different applications of power to cylinders and pestles by which the seeds are pressed or pounded. The oil, after pressing, according to De Guignes, is boiled with Spanish white in the proportion of one ounce to half a pound-of oil; as it begins to thicken, it is taken off and poured into close vessels. It dissolves in turpentine, and is used as a varnish, either clear or mixed with different colours: it defends woodwork from injury for a long time, and forms a good painter's oil. Boiled with iron rust, it forms a reddish brown varnish. In order to prevent its penetrating into the wood when used clear, and to increase the lustre a priming of lime and hog's blood simmered together into a paste is previously laid on.—*Williams' Middle Kingdom, Vol.* I. *p.* 121.

(8498) VARNISHED WARE OF INDIA. In Peninsular India the varnish used by Moocheemen for Palanquins &c., is prepared by melting *Sundaris* (a kind of *Copal* or *Anime* called by by Ainslie *Sandarach*, and mixing it with boiled linseed oil rendered drying with litharge; they do not usually add spirits of turpentine in the way prescribed for making Copal varnish in England. Mr. Rohde knows of no better or more durable polish, for Teak and Chittagong wood particularly, than may be prepared by melting three or four bits of Sundaris of the size of a walnut or small egg, and pouring upon it a bottle full of boiling linseed oil, (*Avisha noona* Tel.,) previously rendered drying by boiling litharge or other drier and after boiling them together for an hour gently adding while cooling a tea-spoonful of Venice turpentine. If too thick it may be thinned with spirits of turpentine. It should be rubbed on the furniture and after a little time, during which it may be exposed in the sun, rubbed off, the rubbing should be continued daily, and the polish should not be again applied for eight or ten days, after which it may be slightly applied every one or two months. Water does not injnre this polish and any stain or scratch may be rubbed over with the polish which cannot be done with French polish. To give the appearance of gold to silver leaf used by the Condapilly Moochies for ornamenting boxes, palanquins &c. a little aloes is dissolved in the varnish which is laid over it. A very good varnish is prepared by Moochies with shell lac and wood oil heated in small quantities.—*Rohde M. S. S.*

(8499) VATERIA, a genus of Plants belonging to the natural order *Dipterocarpaceæ*. It is characterised by having the calyx 5 cleft; segments at length at length reflexd; petals 5, oval, emarginate, twisted in the bud: stamens 40 to 50, short, inserted between the petals and the base of germ; anthers long, linear; capsule 3-valved, 1-celled, and 1-seeded; cotyledons stalked.

The species are two in number, V. *Indica*, which grows all along the Malabar coast and in Canara; and *V. lanceæfolia*, which is common in Silhet. Both species form large trees with entire smooth coriaceous leaves, and terminal panicles of white flowers; and both are valuable not only as timber-trees, but for yielding valuable, almost unique products. *V. Indica* grows to the height of about 60 feet, and yields valuable timber, which is much employed in ship-building, and is not liable to be attacked by the teredo. When the bark is wounded, a pellucid, fragant, acrid, bitter resinous fluid exudes, which in the rays of the sun becomes yellow and fragile like glass. This resin is well known in commerce, and is usually called Copal in India, but when imported into England receives the name of Gun Anime. The fluid resin also makes a good varnish, which is callee Pundum, or Liquid Copal; on the Malabar coast it is often called Piney Varnish, and the tree Piney Varnish-Tree, or Piney Marum. The dry resin, boiled with more or less oil, is used for the purposes of tar and resin; it is also employed by the natives instead of frankincence, Besides these, another valuable product is yielded by this tree, and that is a fatty substance, which is known by the name of the Piney Tallow, or Vegetable Tallow, of Canara. This is obtained by boiling the seeds, when the fatty substance floats to the surface, and on cooling down becomes of the consistence of tallow. In colour the different specimens vary from pale yellow, or fawn, to perfect white. Its general properties, such as its hardness, colour, combustibility, and fusibility, place it between wax and tallow; but it is far superior to the latter, having no disagreeable smell either when burning or at common temperatures.

(8500) VATERIA INDICA. Linn. CHLOROXYLON DUPADA. Buch. Ham.

Piney marum, TAM.	Chadacula, TEL.
Dupa marum, CAN.	Payanee, MALABAR.

This is a very large and stately tree, a native of Malabar, and lately found also in Mysore. The young shoots and all tender parts except the leaves are covered with fine stellate pubescence, leaves alternate, petioled, oblong, entire, from emarginate to obtuse, pointed, smooth, coriaceous, from four to eight inches long and two to four broad, petioles round, about an inch long; stipules oblong, panicles terminal, ramifications rather remote; flowers rather remote, pedicelled, pretty large; bractes oblong, one flowered; calyx five, cleft to the base, divisions oblong, obtuse, villous on the outside, corolla five petalled petals oval, emarginate, broader but very little longer than divisions of the calyx, filaments from 40 to 50, short, broad inserted between the petals and the base of the germ, anthers linear with a single filiform beak; germ superior, conic downy, three celled, cells containing 3 ovules

each, attached to the top of the axis, style longer than the stamens, stigma acute, pericarpium acoriaceous, fleshy, oblong, obtuse, one-celled, three-valved capsule, general size about 2½ inches long and 1½ in diameter, seed solitary of same shape as the capsule.—(*Roxb. Fl. Ind. p.* 601).

The Oil.

Piney Tallow or Doopada Oil, Eng. | Piney Yennai, Tam.

This most valuable tree, which, besides the product under consideration, yields a resin nearly equal, and furnishes an excellent building wood, grows plentifully in the jungles of the Western Coast. The oil which is perfectly solid even in hot climates, is prepared by cleaning the seeds, then roasting and grinding them into a mass. To 5 seers of seed, add 12 seers of water and boil until the oil rises to the surface. Remove the oil, stir the contents of the vessel, and allow it to stand until the following day, when more oil will be observed on the surface, which may be collected and the process repeated. The oil is principally used for lamps, but is very suitable for soaps and candle making.—*M. E. J. R.*

Doopada Resin. The Resin—exudes from the *Vateria Indica*, and constitutes piney varnish. The resin is used as a fragrant insense in Temples, the quantity procurable is very considerable.—*M E. J. R.*

No. 2. White Dammer or Piney resin (*Vateria Indica* and allied species) of Linnœus and Wight. *Choloroxylon Dupada* of Buchanan and Ainslie the *Doopada* resin of Mysore and the *Payanee* or *Piney* of the Malabars.

Variety 1. Piney resin having exuded spontaneously from the tree. Occurs in large lumps of all shapes and varying in color on the outside from a bright orange to a dull yellow, bearing evident marks of having adhered to the bark of the tree. It has a shining vitreous fracture, is very hard and bears a great resemblance to amber.

Its color (internally) is of all shades from a light green to a light yellow, the green tint predominating in the generality of specimens—It is more soluble in alcohol than the Black dammer and burns with less smoke and a more agreeable odour. It is easily distinguishable from all other Indian resins by its superior hardness, its color and amber-like appearance.

Variety 2. *White dammer or Piney resin, obtained by wounding the tree* Occurs either in small lumps or in large masses, generally of a shining appearance and balsamic smell. Has a very cellular structure which is attributable to the mode of collection. Notches being cut in the trunk of the tree sloping inwards and downwards the resin collects in the cavity and is either permitted to dry on the spot or is collected and dried by the application of heat. It is of all shades from light green to light yellow or white and is usually translucent. Specimens are sometimes seen in which from the dessication having been improperly conducted the resin is more opaque, of a dull green color, and full of air bubbles, presenting the appearance of having undergone a partial fermentation. This resin may be recognised by its cellular appearance and balsamic smell—this latter however (which is of course due to the volatile oil it contains) is gradually lost by long keeping or constant exposure to the air, what is called "East Indian copal" and sold in England as gum *anime* exudes abundantly from this tree. It occurs of all shades of color between pale green and deep yellow, the finest pieces are called *kahroba*, Arabic, Amber, and sold as *amber* in the bazars of Bengal; the resin before it hardens is the Piney varnish of Malabar. Besides the uses already alluded to, candles are made of this resin in Malabar, which Dr. Wight informs us, diffuse in burning an agreeable fragrance, give a fine clear light with little smoke, and consume the wick without snuffing. These candles were at one time introduced into England, but a very high duty having been imposed the trade ceased.

(8501) VATERIA LANCELOTA ? Vateria. A species of vateria is a common timber tree in the Provinces of Tavoy and Mergui. The timber is whiter than hopea, and equally good. Indeed, it is often called white thengan, or white hopea, the woods being only distinguished in commerce by their colour. Wallich in his list of Indian woods mentions *Hopea floribunda* as known at Tavoy by the Burmese name of *tantheya*. The tree called at Tavoy pantheya, is certainly not a species of hopea. Its flowers, in white fragrant panicles, are often seen in the Tavoy bazar, and are very unlike the yellow secund flowers of the Hopea.

(8502) VATERIA LANCEÆFOLIA is the other species, which was described by Dr. Roxburgh from Silhet, where it is called Moal. Like its congener, this also exudes a clear liquid from wounds, &c., in the bark, which soon hardens into an amber-coloured resin. From this the natives distil a dark-coloured and strong-smelling resin called Chooa, and Chova and Gond by the Brahmins, who use it as incense.—*Eng. Cyc.*

(8503) VATERIA ROXBURGHII. Indian gum anime tree. In Hindustan, *Vateria indica* produces a resin which is sometimes called copal in India, and gum anime in England; but it does not appear to be known that in the Tenasserim Provinces, another species of the same genus yields almost a precisely similar resin. When in bloom the tree is quite ornamental, and diffuses the fragrance of its flowers for a great distance around.—*Mason.* Dr. Wight gives figure Vateria Roxburghiana, 26.

(8504) VATICA ROBUSTA.

Saul Hind. | Googilam, Tel.

A wood in great repute, belonging to the *Dipterocarpeæ;* it is most valuable for house and ship building, Vats for liquids, door frames, and the rails and battens of doors; it is not suited for planks, it twists, shrinks, and warps, whenever the surface is removed, even after many years' seasoning. This wood is in general use for building purposes in the Ganjam and Vizagapatam Districts. "From Colonel Baker's excellent experiments, it appears that, compared with Teak, its strength is about 1121 to 869. From Major H. Campbell's valuable experiments, unseasoned Saul broke with 1,391lbs. It is unquestionably the most useful grown India timber for enginering purposes," (Jury Reports Great Exhibion.) broke with a weight of 1308 lbs.; seasoned saul with 1319 lbs. An another in Tenasserim refers all the species of *Vatica* to the mountains, but they have one that drops its curious winged fruit from cliffs that overhang the sea.—*Mason.* Two or three species are found in Goomsur forming extensive forests and affording to the inhabitants incense, dammer and wood oil. Judging from the imperfect specimens collected by Dr. Maxwell and Capt. McPherson, one of them belongs to Roxburgh's genus *Shorea* apparently *S. robusta.* Both these gentlemen mention *Chloroxylon dupada* as being one of them, but this is thought to be a mistake originating in a statement of Dr. Ainslie that this is the botanical name given to the Indian dammer tree by Dr. Buchanan, but which was an error of his arising from his not being aware that several trees produce dammer and that his *Chloroxylon Dupada* was already described by Linnæus under the generic name of *Vateria.* The Shoreas (Roxb.) or Vaticas (Linn) and Vaterias yield the solid product called dammer and Pinay whilst the produce of the Dipterocarps retains its fluidity and is the "wood oil" of the bazars. The Camphor tree of Sumatra is a species of *Vateria* (*Shorea camphorifera,* Roxb) The Vateria Indica (chloroxylon dupada of Buchanan and Ainslie and the Piney marum of the Hindoos) produces a resin resembling Copal, much finer than that procured from other species, natives of India, the finer specimens of which are as transparent as amber and nearly colorless. It is procured by the very simple process of cutting a notch in the tree sloping inwards and downwards. This is soon filled with the juice, which in a short time hardens by exposure to the air.

(8505) VEGETABLE IVORY, is occasionally seen in India as the knobs of walking sticks. It is imported into Europe and North America from the river Magdalina, and in some years no less than 150 tons of it were imported into England, where the nuts may be purchased for a few pence each and even at a cheaper rate, for in August 1854, 1000 were sold for 7 shillings and 6 pence. The Ivory plant is confined to the continent of South America, where it grows between the 9th degree of North and the 8th degree of South latitude and the 70th and 79° of West longitude, and is found in narrow valleys and damp localities from the coast to 3000 feet above the sea. From the kernels or albumen of the fruit, the American, as well as European turners fashion the knobs of walking sticks, the reels of spindles and little toys which are whiter than animal ivory, and equally hard when dry, but soften when placed into water. The plant is supposed to belong to Endlicher's class Spadiciflora and Lindley's alliance Arales, but Martius regards it as the type of a new natural order named Phytelephanteæ. It is called the Ivory Palm.—*Seeman.*

(8506) VEGETABLE KINGDOM. This term is applied collectively to the various forms of Plants, as the terms Animal and Mineral Kingdoms are applied to Animals and Minerals. Several methods have been proposed by DeCandolle and others for giving an idea of the distribution of vegetation over the surface of the globe. In the following remarks we have followed that of Professor Schow, in his 'Notes for a Course of Lectures on the Distribution of Plants.'

1. Region of Saxifrages and Mosses, or the Alpine Artic Flora: temperature 1·75 to 41° Fahr. This corresponds with the hyperborean region of De Candolle and other writers, and comprehends all countries within the polar circle, namely Lapland, the north of Russia and Siberia, Kamtchatka, Labrador, Greenland, and Iceland, and also part of the Scottish and Scandinavian mountains, as well as the mountains of the southern and central parts of Europe, with sufficient elevation to possess an alpine vegetation. This region is characterised by the abundance of mosses and lichens, and of the families *Saxifragaceæ, Gentianaceæ, Alsinaceæ, Saliceæ,* and *Cyperaceæ.* There is an entire absence of tropical families, and only a few plants of the temperate zone. The beech and fir occur in forests, or there is a destitution of trees. Annuals are also scarce, and the blossoms of the flower are large in proportion to the root of the plant, and of a pure colour.

2. Region of the *Umbelliferæ* and *Cruciferæ*: temperature 27·5° to 56·75°. This comprehends the whole of Europe, except those districts which belong to the preceding region, from the Pyrenees, the mountains of the south of France, of Switzerland, and the north of Greece, to the greater part of Siberia, and the country about Mount Caucasus. This region is particularly distinguished from that of the same parallel in north America by the presence of cruciferous and umbelliferous plants. It is not easily distinguished

from the next region, but the *Fungi* abound more, and it approaches the last region in the abundance of *Cyperaceæ* Nearly all its trees are deciduous, and its meadows are exceedingly flourishing. There is a division of the *Compositæ*; the plants belonging to the Cichoraceous division of that order, being found in the northern districts, whilst those belonging to the Cynarocephalous are found in the south of it. The prodominating trees are the Scotch Fir, the Alder, the Beech, the Birch, the Poplar, the Elm, and Lime. The shrubs are the Heaths, the Sloe, &c. The principal cultivated plants are the Wheat, Barley, Oats, Maize, Potatoes, &c; Apple, Pear, Gooseberry, Currant, Vine, Strawberry, Cucumber, Melon, the Cabbage, Turnip, Peas, Beans, and other forms of *Leguminosæ*; Carrots, Hops, Hemp, Flax, &c.

3. The Region of *Labiatæ* and *Caryophyllaceæ*, or the Medieterranaan kingdom: temperature 54·5° to 72·5°. This includes the region of the Mediterranean Sea, limited on the north by the Pyrences, the Alps, the Balkan, the Caucasus; on the south by the Atlas and the deserts of North Africa; on the east by Taurus. It contains more or less of the orders belonging to the last region; but *Labiatæ*, *Caryophyllaceæ*, *Boraginaceæ*, *Cistaceæ* and *Liliaceæ* abound. A few tropical plants now and then appear amongst them, belonging to the orders *Palmaceæ*, *Terebintaceæ*, and *Lauraceæ* *Solanaceæ* and *Leguminosæ* are more abundant than in the last, evergreens increase, and the vegetation never entirely ceases; but verdant meadows are more rare than in the last. Madeira, Azores, and the Canary Islands, belong to this region, and their Flora approaches to that of tropical Africa. The cultivated plants are similar to the last, to which are added the Olive, Orange, Lemon, Mulberry, Fig, Rice, &c.

4 The region of *Asteraceæ* and *Solidaginaceæ*, or northern North-American kingdom: temperature 9.5° to 59°. It embraces North America from the southern limits of the first kingdom to 36°. N. lat. There are a greater number of *Coniferæ* than in the second kingdom, and there are but few *Umbelliferæ*, *Cruciferæ*, *Cichoraceæ*, and *Cynarocephalaceæ*. There is but little cultivation: where there is any it resembles that of the second kingdom. Whortleberries, Oaks, Firs, Michaelmas Daisies, and Golden Rods are its great characteristics.

5 The Region of *Magnoliaceæ*, or Southern North-American kingdom, between 36° and 30° N. lat: temperature 59° to 72·5°. There is here an approximation to tropical vegetation, as seen in the frequent appearance of the genera *Canna*, *Chamærops* *Yucca*, *Zamia*, *Laurus*, *Bignonia*, *Passiflora*, *Cassia*, *Sapindus*, &c. There are comparatively few plants that are characteristic of the two preceding kingdoms. The Magnolias predominate, and are accompanied with other genera bearing broad shining leaves and large flowers. The cultivated plants are those of the third region, with the exception of the Olive: Rice is more abundant, and in the southern districts the Sugar-Cane is grown.

6. The Region of Camellias, and *Celastraceæ*, or Chino-Japanese kingdom. It embraces Japan and Northern China from 30° to 40° N. lat.: temperature 54-5° to 68°. Too little is known of this region to enable us to state positively what are its characteristics. Its vegetation is more tropical than European. With Zamas, Ginger, Bananas, and Custard-Apples, are found Buckthorns and Honeysuckles, thus giving this region a mixed character. Its cultivated plants, in addition to those of the previous regions, are the *Cycas* for Sago, the Tea-plant, the Caladium, &c.

7. The Region of *Zingiberaceæ*, or Indian kingdom: temperature 65·75° to 81·5°. This includes the Indian peninsulas east and west of the Ganges, together with the islands between India and Australia. Tropical orders are numerous in this region, as *Palmaceæ*, *Araceæ*, *Euphorbiaceæ*, *Bignoniaceæ*, *Bytlneriaceæ*, &c. Very few plants belonging to *Cyperaceæ*, *Coniferæ*, *Labiatæ*, *Rosaceæ*, *Ranunculaceæ*, or *Cruciferæ* are seen. The trees never lose their leaves, and produce large magnificent flowers, and are covered frequently with climbing and parasitical plant. Ginger, Zedoary, Cardamom, Arrowroot, Catechu, Cassia, Cinnamon, Caoutchouc, Tamarinds, Sago, Rice, Cocoa-Nut, Coffee, Cubebs, Cloves, Pepper, Oranges, and Gamboge, are the cultivated and natural productions of this prolific region.

8. The Regions of the Himalaya: temperature 36·5° to 65·75°. It includes the highlands of India, or the mountain terraces lying on the south of the Himalayan range, Kumaon, Nepaul, Bootan, having an elevation of from 4000 to 10,000 feet. The tropical forms of the last kingdom decrease manifestly here, such as *Scitaniaceæ*, *Palmaceæ*, *Cycadaceæ*, &c. European forms are not unfrequent, as *Cyperaceæ*, *Amentaceæ*, *Coniferæ*, *Primulaceæ*, *Rosaceæ*, *Cruciferæ*, &c. The Ferns and *Orchidaceæ* are abundant. The cultivated plants are the corn and fruit of Europe, varying with more tropical productions according to elevation.

9. The Region of *Polynesia* includes the islands between Hindustan and Australia, and has a temperature from 65·75° to 83·75°. This region is similar to the Indian kingdom, and is sometimes included in it. The cultivated plants, in addition to those of the Indian kingdom, are the Bread-Fruit-Tree, the Nutmeg, the Camphor-Tree, and the Cotton-Tree.

10. The Region of Java is little known, and has a vegetation probably similar to the Himalayan region.

11. The Oceania Region, or South Sea Is-

land kingdom, includes all the islands of the South Sea within the tropics, and has a temperature of 72·5° to 81·5°. The flora of these islands is poor, and approximates more closely to that of Asia than to that of Africa, and has some relation to that of Australia. The bread-fruit is the most characteristic production of these islands, but is not confined to them.

12. The region of *Balsomodendra*, or the Arabian kingdom, includes the south westerly mountainous part of the Arabian peninsula. The temparature cannot be stated, but the character of its vegetation is generally tropical, assuming the forms of that of India. The cultivated plants are also principally those of India.

13. The Desert Region includes North Africa south of the Atlas, and the Mediterranean Sea between 15° and 30° N. lat, and the northern part of Arabia. The mean temperature is 72° to 86° It has necessarily a very poor flora, having but few even characteristic genera. It is only cultivated in the oases, where the *Phœnix dactylifera*, the *Sorghum vulgare*, with Wheat and Barley, and some of the fruits of Europe and India, constitute the prominent plants.

15. The Region of tropical Africa includes Africa from 15° N. lat. to the tropic of Capricorn. Temperature 72°5 to 86°. This flora is neither rich nor rare ; it abounds in *Leguminosæ*, *Rubiaceæ*, and *Cyperaceæ*. The *Adansonia* is the characteristic genus.

15. The Region of *Cacti* and *Piperaceæ* includes Mexico and South America to the Amazon River, and to a height of 5000 feet above the level of the sea. Temperature 68° to 83°74. The orders which characterise this region are *Bromeliaceæ*, *Piperaceæ*, *Passifloraceæ* and *Cactaceæ*. The orders which are mostly tropical are here less numerous, whilst extra-tropical orders are more abundant. The most abundant genera are *Phytelephas*, *Kunthia*, *Thoninia*, *Theobroma*, *Guazuma &c.* The cultivated plants of this district are the Maize, *Sorghum vulgare*, *Dioscorea*, *Convolvuln* ; also the Plantain, Cocoa-Nut, Pine-Apple, Tamarind, Cacao, Vanilla, Coffee, Sugar, Tobacco, Cotton, &c.

16. The Region of the Mexican Highlands includes the mountains of Mexico above 5000 feet elevation. Temperature from 65°·75 to 79°·25. In this district the more tropical forms of vegetation, as the Tree-Ferns, the Palms; Passion-Flowers, Euphorbiums, and Pepper, decrease or altogether disappear. The extra tropical forms are more numerous, as the Willow, Oak, Fir, Cypress, Sago, Horehound, Whortle berry, Heath, and various forms of *Umbelliferæ*, *Rosaceæ*, *Caryophyllaceæ*, and *Ranunculaceæ*. The cultivated plants are maize, the European *Cerealia*, and fruits. In the highest mountain-ranges the vegetation has an alpine aspect.

17. The Region of *Cinchonaceæ*. This embraces the Andes from 5000 to 9000 feet in elevation, and between 20° S. lat., and 5° N. lat., having a temperature from 59° to 68°. The extra-tropical forms become very frequent in this region, and only a few tropical forms remain. Some of the most common genera are the *Cinchona*, *Gay-Lussacia*, *Loasa*, *Lilæa*, *Cervantesia &c.* The cultivated plants are very seldom tropical. Maize and coffee are sometimes grown, with European *Cerealia*, and fruits, Potatoes, and *Chenopodium Quinoa*.

18. The Region of Escallonias and Calceolarias includes the Andes at more than 9000 feet above the level of the sea, between 20° S. lat. and 5° N. lat. Temperature 34.25° to 59°. Tropical plants almost entirely disappear in this region, only now and then a straggler appearing ; whilst the forms which distinguish the colder and polar regions become frequent, such as the Lichens, Mosses, Sorrels, Plantagos, Gentians, Currant, Brambles, &c. The most prevalent orders are the Grasses, Heaths, and *Synantheraceæ*. There are no large trees, and a great many shrubs.

19. The West Indian Region, including the West India Islands, with a temperature of 59° to 79.25°. The vegetation of these islands bears the same relation to the continent which that of the Polynesian islands does to China. It is chiefly distinguished by the greater quantity of Ferns and *Orchidaceæ*. The cultivated plants are the same as those of Mexico.

20. The Region of Palms and *Melastomaceæ*, or Brazilian kingdom, including Brazil, or South America, on the East of the Andes, between the equator, and the tropic of Capricorn ; temperature 56° to 83·7°. This region is remarkable for the number of its genera and species, the size of individual trees, the dense forests, and the numerous climbing and parasitical plants. Vegetation seems here to attain its greatest activity and energy. The orders which abound most are *Palmaceæ*, *Homaderaceæ*, *Gesriaceæ*, *Melastomaceæ*, *Sapindaceæ* and, altogether confined to this region, *Vochyaceæ*. The cultivation is very similar to that of Mexico.

21. The Region of Woody *Compositæ*. In South America, on the east of the Andes from the tropic of Capricorn to 40° S. lat : temperature 59° to 74·75°. There are but few tropical plants in this region, and extra tropical plants, especially European forms, are abundant, more than half being common to this region and Europe. The Woody *Compositæ* abound. This region consists chiefly of plains (pampas), which for hundreds of miles present almost the same vegetation, consisting chiefly of Thistles and Grasses. Wheat, the Vine, and the Peach, are cultivated.

22. The Antarctic Region includes the south-westerly part of Patagonia, Tierra del Fuego, between 50° and 55° S. lat. : temperature 41° to 47·5°. In this region there are no tropical plants, and its vegetation resembles in a great

measure the North-European flora (region 2). In some of the genera there is an approach to the South African and Australian flora.

23. The Region of Stapelias and Mesembryanthemums. This embraces South Africa from the tropic to 35° S. lat.: temperature 54·5° to. 72·5°. The vegetation of this region is not luxuriant, but it is very rich in forms. There are no dense forests nor climbers, but many succulent plants. The orders *Restiaceæ*, *Iridaceæ*, *Proteaceæ*, *Ericaceæ*, *Ficoidaceæ*, *Bruniaceæ*, *Diosmaceæ*, *Geraniaceæ*, *Oxalidaceæ*, and *Polygalaceæ*, embrace its characteristic vegetation. On the sandy coasts the genera *Stapelia*, *Mesembryanthemum*, and *Diosma*, are found, and on the mountains *Protea*, *Erica*, and *Brassula* The cultivated plants are those of Europe, with the *Musa Paradisiaca*. *Convolvulus Batatas*, the Tamarind, and *Sorghum Caffrorum*.

24. The Region of *Eucalypti* and *Epacridaceæ*. It includes extra-tropical Australia and Van Diemen's Land: temperature 42°25 to 72°·5' Vegetation is not abundant in this region; but this deficiency is compensated by the variety and peculiarity of its forms. The most abundant of the trees are the *Eucalypti*, which form three-fourths of all the woods. Next come the genera of *Proteaceæ*, *Banksia*, *Hakea*, *Dryandra*, *Grevilleæ*, &c.: and next to these follow *Epacridaceæ*, *Diosmaceæ*, and *Casuaraceæ*. Its cultivated plants are all European.

25. The Region of New Zealand includes the two New Zealand isles: temperate, One-half of the species are European. The vegetation is not characterised by the prevalence of large groups. Some of the genera approximate the South African flora, and some the Australian. (The following works should be consulted on the geography of plants:—Linnæus, *Stationes Plantarum*; Humboldt and Bonpland, *Essai sur la Geographie des Plantes*; Humboldt *De Distributione et Geographica Plantarum*; Brown, *General Remarks on the Botany of Terra Australis*; Schouw, *Grundzuge einer Allgemeinen Pflanzen-Geographie*; Meyen, *Grundriss der Pflanizen-Geographie*; Bischoff, *Lehrbuch der Botanik*; Hooker, *in* Murray's *Dictionary of Geography*; De Candolle, art. *Geographie des Plants—Dict. des Sciences Naturelles*; Lindley, *Int. Bot.* 2nd, ed.; Meyen, *Geography of Plants*, translated for Ray Society by Miss Johnston; Balfour, *Class-Book of Botany*; Johnston, *Physical Atlas*.

(8507) VEGETABLE MARROW, or SQUASH.

Suppara Roomro, Hind.

This is a very delicate vegetable of the gourd species. The crooked-necked, when about six inches long, is well flavoured, but soon gets hard and stringy. The pear-shaped is the best of any, but must be dressed when young. Propagation only by seed, and the plants should never be removed, but remain where sown, only thinning the weakly ones. The soil should be a rich loam, the same as for cucumbers. Train the plant on sticks. It is often necessary to fertilize the female blossoms, by approaching the anthers of the male flower when charged with pollen.—*Riddell.*

(8508) VEGETABLES OF SOUTHERN INDIA. Mr. Jaffrey gives the following list.

Abelmoschus esculentus.
Achyranthes aspera.
Æschynomene aspera.
Agati grandiflora.
Alternanthera sessilis
Amarantus tenuifolius.
,, spinosus.
,, campestris.
,, tristis.
,, frumentaceus.
,, polygamus.
,, oleraceus.
,, atropurpureus.
Amorpophaluscampanulatus,
Andropogon esculentum.
Æruа lanata.
Artocarpus integrfolius.
Asystasia Coromandeliana.
Atriplex heteranthera.

Batatas edulis.
Bauhinia albida.
,, purpurea.
Bergera Kœnigii.
Boerhavia procumbens.
Bryonia coccinia,....
Byttneria herbacea.

Caladium esculentum.
Capsella bursa-pastoris.
Capsicum frutescens.
,, minimum.
Capparis brevispina.
Caralluma adescendens.
Carica papaya.
Cleome pentaphylla.
Cocos nucifera.
Commelina communis.
Coriandrum sativum
Cucurbita maxima.
,, citrullus.
,, ovifera.
Cucumus usitata
Cyamopsis psoraloides.
Cynodon dactylon.

Dillenia speciosa.
Desmanthus natans.
Dioscorea purpurea.
,, aculeata.
Dolichos ensiformis.

Erythroxylon areolatum.
Euphorbia pilulifera,
Emblica officinalis.

Ficus racemosa.
Foeniculum vulgare.

Glinus trianthemoides.
Gisekia pharnaceoides.

Hibiscus sabdariffa.
,, surattensis.
Hoya viridiflora.

Ipomœa separia.
,, reptans.
,, reniformis.

Lablab vulgaris.
Lagenaria vulgaris.
,, pipo.
Leptadenia reticulata.
Leucas aspera.

Mangifera Indica.
Momordica charantia var. muricata.
Momordica charantia.
Morinda umbellata.
Moringa pterygospermum.
Musa sapientum.

Nelumbium speciosum.

Ocymum villosum.
Oxalis corniculatus.

Pisonia morindifolia.
Portulacca oleracea.
Portulacca quadrifida.
Premna integrifolia.
,, serratifolia.
Psophocarpus tetragonolobus.

Rivea fragrans.
Rothia trifoliata.
Rumex vesicaria.

Salsola Indica.
Solanum incertum.
,, melongena.
,, Lycopersicum.
,, torvum.
Sonchus oleraceus.
Spinacia oleracea.
Spondias mangifera.
Stellaria media.
Suæda Indica.

Tamarindus Indica.
Trianthema obcordata.
Tribulus terrestris.
Trichosanthes anguina.

Vitis quadrangularis,

Webera tetrandra.

Zizyphus jujuba.

Jaffrey, p. 63.

There is a great variety of vegetables indigenous or cultivated in the Tenasserim Provinces; but the best are scarce, and rarely for sale in the bazars. Nearly every plant produces a vegetable for the natives. The Burman books say, there are ten kinds of vegetables, or pot herbs, corresponding to the parts of a plant that furnish them.—*Mason.*

(8509) VEGETABLE PRODUCTIONS OF COMMERCE. Professor Solly, in one of the series of Lectures on the results of the Great Exhibition, delivered before the Society of Arts, early in 1852, made some practical remarks bearing on the subject:—

"If (he said) you were to place before any manufacturer specimens of all the substances which could be employed in his particular manufacture, and if you could tell him from whence each could be procured, its cost, the quantities in which he might obtain it, and its physical and chemical properties, he would soon be able to select for himself the one best suited for his purposes. This, however, has never happened in relation to any one art; in every case manufacturers have had to make the best of the materials which chance or accident has brought before them. It is strange and startling, but nevertheless perfectly true, that even at the present time there are many excellent and abundant productions of nature with which not only our manufacturers, but, in some instances, even our men of science, are wholly unacquainted. *There is not a single book published which gives even tolerably complete information on any one of the different classes of vegetable raw produce at present under our consideration.* The truth of these remarks will be felt strongly by any one who takes the trouble to examine any of these great divisions of raw materials. He will obtain tolerably complete information respecting most of those substances which are known in trade and commerce; but of the greater number of those not known to the broker, he will learn little or nothing. Men of science, for the most part, look down upon such knowledge. The practical use of any substances, the wants and difficulties of the manufacturer, are regarded as mere trade questions, vulgar and low—simple questions of money. On the other hand, mere men of business do not feel the want of such knowledge, because, in the first place, they are ignorant of its existence, and secondly, because they do not see how it could aid them or their business; and if it should happen that an enterprising manufacturer desires to learn something of the cultivation and production of the raw material with which he works, he generally finds it quite impossible to obtain any really sound and useful information. In such cases, if he is a man of energy and of capital, he often is at the cost of sending out a perfectly qualified person to some distant part of the globe, to learn for him those practical details which he desires to know. This is no uncommon thing; and many cases might be stated, showing the great advantages which have arisen to those who have thus gained a march upon their neighbours."

That quaint old English poet, Herbert, who flourished in the fifteenth century, in a short poem on "Providence," has graphically described, in his unique vein, the sentiment which forces itself upon us in view of the numerous discoveries of the age in which we live:—

"All countries have enough to serve their need.
* * * *
——The Indian nut alone
Is clothing, meat and trencher, drink and can,
Boat, cable, sail, and needle, all in one."

"The addition (it has been well observed) of even a single flower, or an ornamental shrub, to those which we already possess, is not to be regarded as a matter below the care of industry and science. The more we extend our researches into the productions of nature, the more are our minds elevated by contemplating the variety as well as the exceeding beauty and excellence of the works of the Creator."-*Simmonds.*

(8510) VEGETABLE WAX was sent from Shanghae in China, from St. Domingo in the Northern parts of which the plant is indigenous, and a remarkable specimen from Japan. This substance from its high melting point and other physical characteristics has of late attracted a good deal of attention, it is admirably suited as a material for the manufacture of candles.—*Simmonds' Commercial Products, p.* 540.

(8511) VEKKALI TREE WOOD.

Vekkali maram, TAM.

A serviceable variegated hard close-grained wood employed by the Natives in house-building and also for making doors, windows, handles of instruments, &c. &c.—*Ains. Mat. Med. p.* 206.

(8512) VELASSALU. The Tamul name of the Ceylon White Iron-wood, which grows to about fourteen inches in diameter, and ten feet high. It is used by the natives for huts, poles, &c. and where strength and durability are required.—*Edye, Ceylon.*

(8513) VELATTE, the Tamul name, Ballangu, in Portuguese, of a Ceylon tree, which grows to about fourteen inches in diameter, and eight or ten feet in height. It is remarkably strong, and is used by native carpenters in vessels. It produces a fruit which is eaten by the natives.—*Edye, Ceylon.*

(8514) VELEANA; the Tamil name of a Ceylon tree which grows to about twelve inches in diameter, and eighteen feet in height. In appearance it resembles English oak. The native carpenters use it in boats and vessels' frames, knees, &c.—*Edye, Ceylon.*

(8515) VELLE AERE, the Tamil name of a Ceylon tree which is white Aere. It grows to

about twelve or eighteen inches in diameter, and twenty feet in height. It is a light wood, and is generally converted into catamarans, being considered useful for that purpose only.—*Edye. Ceylon.*

(8516) VELLE NEALEA, the Malayala name of a Ceylon tree which grows to about ten inches in diameter, and ten feet in height. The branches of this tree are very strong, and are used for the frames of native vessels.—*Edye, Ceylon.*

(8517) VELL VIEN, the Tamil name of a Ceylon tree which is about fourteen inches in diameter, and eight feet in height. Its strength and durability lead the natives to prefer it to other wood for the purpose of supports to huts.—*Edye. Ceylon.*

(8518) VELLUM. A fine, white, smooth, kind of parchment, made of calfs-skin.—*Faulkner.*

(8519) VELVET.

Velours, Fr.	Mukhmull, Guz. Hind.
Sammet, Ger.	Velluto, It.

A beautiful silken fabric, having a soft shag or pile on the outside. Velvet is also made of cotton, a strong kind of which called *Velveteen*, is used for men's apparel.—*Faulkner.*

(8520) VENDELLIA, a genus of plants belonging to the natural order *Scrophulariaceæ*. The species are natives of warm parts of the world such as India, Burma, China, and Brazil, forming smooth or hairy herbs, with tetragonal stems; leaves opposite, usually toothed.

(8521) VENERIDÆ, a family of Conchiferous *Mollusca*.

The genus *Venus* of Linnæus was arranged by him in the second section (*Bivalvia: Conchæ*) of his *Testacea Mollusca Simplicia, obtecta Testa Calcarea*, between *Donax* and *Spondylus*.

Dr. J. E. Gray places the *Veneridæ* as the first family of his order *Phyllopoda*, with the following genera:—*Artemis, Cytherea, Meroe, Gratelupia, Trigona, Chione, Circe, Dosina, Mercenaria, Anomalocardia, Cypreia, Venus, Tapes, Venerupis*, and *Clementia*.

The *Veneridæ* are immediately followed in Dr. Gray's arrangement by the *Cyrenidæ*, which comprise the following genera:—*Cyrena, Gelonia, Velorita, Cyclas*, and *Pisidium*.

The *Cardiadæ* immediately follow. Woodward, in his 'Manual,' places the *Veneridæ* between the *Cyprinidæ* and *Mactridæ*, and includes in it the following genera:—*Venus, Cytherea, Meroe, Trigona, Artemis, Lucinopsis, Tapes, Venerupis, Petricola*, and *Glaucomya*. Our limits will only permit the illustration of this family by the notice of a few Asiatic genera.

(8522) *Cyrena.*

(8523) *C. fuscata* is brownish-green, with numerous transverse subimbricate furrows; violet within and at the umbones; the lateral teeth very much elongated transversely and dentilated. It is a native of the Chinese rivers and those of the Levant.

(8524) *Megadesma.*

(8525) *M. radiatum* (*Galathea radiata*, Lam; *Potanophila radiata*, Sow.) Under the epidermis milk-white, marked with violet towards its base, and ornamented with violet rays, generally from two to four in number. It is found in the rivers of Ceylon and of India.

Cytherea occurs fossil below the Chalk.

Venus.—Shell equivalve, inequilateral, transverse, or suborbicular. Three cardinal teeth, approximated in each valve; the lateral ones diverging at the umbo. External ligament covering the external anterior fissure.

The number of species recorded by M. Deshayes in his Tables is 11 recent and 43 fossil (tertiary.) Of these *V. verrucosa, V. plicata, V. gallina, V. decussata, V. radiata, V. Brongniarti, V. dysera, V. geographica*, and *V. paphia*, are noted as recent and fossil (tertiary).—*Eng. Cyc.*

(8526) VENGA MARAM.

Yepi; Vriksha, Can.	Yapa Chettoo, Tel.

This is reckoned by the Natives of the Circars a very useful wood, it is of a reddish colour and is employed in making doors and windows and other common purposes. It is in common use both for building and for furniture in the Masulipatam district, it is a very heavy wood but not strong, when used for rafters, it should be cut very broad in comparison to its thickness.—*Rohde, M.S.S.*

(8527) VENGULA CYAM, the Tamil name of a Ceylon tree of little value. It grows to about twelve inches in diameter, and six feet high; and produces a fruit which is not made use of.—*Edye, Ceylon.*

(8528) VENTILAGO, a genus of Plants consisting of only a single species, belonging to the natural order *Rhamnaceæ*. The calyx is 5-parted; the corolla 5-petalled; stamens 5; germ 2-celled, hid in the crenulated flat disc; style 2-cleft. Samara half superior, globose, long-winged, 1-seeded; embryo erect with perisperm. The species *V. maderaspatana* is common in different parts of India, from the peninsula to the north-western provinces; it is also found in the Indian islands, as it is figured and described (Rumph., 'Herb. Amb.,' 5. t, 2) by the name of *Funis viminalis*. It forms a large climbing shrub with stiff branches; is often dicœcious, with flowers having an offensive smell, not unlike that of *Sterculia fœtida.—Eng Cyc.*

(8529) VERAETAL, the Tamil name of a Ceylon tree which grows to about fourteen inches in diameter, and eight feet high. It resembles mahogany, but is capable of a more brilliant polish; the natives use it for superior purposes. It produces a kind of fruit which is of little use.—*Edye, Ceylon.*

(8530) VERAM PELOW, the Malayala and Tamil name of a Ceylon tree known by that of Jackwood. This tree is common throughout India, and is of great value to the natives, its fruit and nuts forming a considerable part of their food. The wood when cut is yellow, but, when exposed to the air, turns as dark as mahogany, to which it is superior in brilliancy. It is generally used in articles of furniture for the Europeans, and for house-work, and is considered handsome : the largest tree of this kind which I have seen was about three feet in diameter, and from thirty to thirty-five feet high. In Canara, this was the wood which Tipu Sultan used for his vessels at Honore, where his naval depot was formed.—*Edye, Ceylon.*

(8531) VERATRUM NIGRUM. MELANTHACEÆ. This genus takes its name from the dark colour of its roots. The flowers are mostly white, dark purple, and green. It is cultivated in a rich garden soil by seed, or dividing the roots, which contain powerful medicinal properties.—*Riddell.*

(8532) VERBENACEÆ, *Verbens*, a natural order of Exogenous Plants. The species are trees or shrubs, sometimes only herbaceous plants, with generally opposite, simple, or compound leaves without stipules. The flowers are in opposite corymbs or spiked alternately, sometimes in dense heads, and very seldom axillary or solitary. The calyx is tubular, persistent, inferior ; the corolla is hypogynous, monopetalous, tubular, deciduous, generally with an irregular limb ; the stamens 4, didynamous, seldom equal, occasionally 2 ; ovary 2-4-celled ; ovules erect or pendulous, solitary or twin ; style 1 ; stigma bifid or undivided ; fruit nucamentaceous, sometimes berried, composed of two or four, nucules in a state of adhesion ; seeds erect or pendulous, albumen none, or in very small quantity ; embryo always erect. (Lindley.) The great difference between these plants and those of *Lamiaceæ* or *Labiatæ* consists in their concrete carpels, terminal style, and the absence of oil-glands from their leaves.

(8533) VERBENA, a genus of Plants, the type of the natural order *Verbenaceæ*. Most of the species of this genus are weeds, and are generally inhabitants of Europe and North America. The genus is known by a tubular calyx with 5 teeth, one of them generally shorter than the rest ; a tubular corolla with the limb rather unequal, 5-cleft ; the stamens included, and sometimes only 2 ; the seeds 2 or 4, inclosed in a thin evanescent pericarp.—*Eng. Cyc.*

These pretty little flowering plants do not endure the heat, require shelter and good drainage during the hot months. Propagated by layers and cuttings.—*Jaffrey.*

(8534) VERBENA AUBLETIA, Rose-coloured Vervain, is a native of North America, in Georgia and the Carolinas, and was first brought to Europe in 1774. It is known by its fine pink or crimson flowers.—*Eng. Cyc.*

(8535) VERBENA OFFICINALIS. Common Vervain, has 4 stamens with an erect somewhat hispid stem ; the leaves lanceolate, inciso-serrate, or trifid, with the segments cut rough ; the spikes filiform, somewhat panicled, and the flowers rather remote. This plant is common in England. It is not found in Ireland. It is an inhabitant also of Australia. This is the 'holy herb,' of Dioscorides, who ascribed great powers to it, especially in incantations, In most countries where it grows it seems to have been invested with extraordinary powers. It at one time entered into the composition of various charms and love-philters, and has even now a popular reputation for predisposing persons favourably towards those who administer a dose to them.—*Eng. Cyc.* It is a native of the warm parts of Europe, this plant is described as astringent, febrifuge, &c. but has fallen into just neglect. Still among the ancient Greeks and Gauls it held the highest place in popular estimation ; it was used to purify the altars, and formed the crowns of heralds and ambassadors. The Druids gathered it with the same marks of veneration as the misseltoe, next to which it was revered. Formerly employed extensively as a medicine it was also the base of numerous philters, or love potions, and hence derived its name of *Veneris vena*, or source of love.—*O'Shaughnessy, p.* 484. It is well known for its strong aromatic lemon scent. It grows from cuttings or layers, and no doubt would also from seed, as it blossoms freely.—*Riddell.*

(8536) VERBENA TRIPHYLLA. THE LEMON SCENTED VERBENA.

Peela-Bhungara DUK.

Lemon-Scented Vervain, has panicled spikes with minutely distantly-toothed leaves, three in a whorl ; stem shrubby. This plant is a native of Chili. It is used on the continent for making an infusion, which, when cold, is administered as a cooling drink in fevers, slight catarrhs, &c. *Eng. Cyc. Riddell.*

(8537) VERDA CANARA, the Tamil name of a Ceylon tree which grows to about twenty inches in diameter, and from forty to sixty feet high At times some of the country vessels get their masts from this tree : it is not durable or strong.—*Edye, Ceylon,*

(8538) VERDIGRIS. SUB-ACETATE OF COPPER.

Zungar, ARAB.	Zungar, PERS.
Jingal, CASH.	Jar, RUS.
Vert-de-gris, FR.	Cardenillo, Verdete, Verdegris, SP.
Grunespan, GER.	Pittalata, SANS.
Chungal, GUZ. HIND.	Vungalap-patchci, TAM.
Verderame, IT.	Zenghalie-patse, TEL.
Cupri-subacetas, LAT.	
Sennang, -MAL.	

A kind of rust of copper, of a beautiful bluish green colour, formed from the corrosion of

copper by fermented vegetables. It is extensively used by painters, and in dyeing; and to some extent in medicine —*Faulkner.*

(8539) VERDITER. A blue pigment, generally made by decomposing a solution of sulphate of copper, with the addition of chalk.—*Faulkner.*

(8540) VERJUICE.

Verjus, Fe.	Agresto. It.
Agrest. Ger.	Agraz, Sp.

A kind of harsh vinegar, made of the expressed juice of the wild-apple or crab. The term is also applied to the expressed juice of unripe grapes.—*Faulkner.*

(8541) VERMICELLI.

Meelneepen, Proppen, Dut.	Save, Guz. Hind.
Vermicelli, Fr.	Vermicelli, Tagliolini, It.
Nudeln, Ger.	Alterias Sp.
	Seme Tam. Tel.

A thready paste, formed of flour and water used in soups, &c. Indian vermicelli is eaten in a boiled state, mixed with sugar and milk.—*Faulkner. Vermicelli, or Vermichelly* is an Italian composition of various edible articles, reduced to a paste, and formed into slender wormlike pieces, from whence its name. *Locksoy* is a kind of Vermicelli, prepared from rice at Cochin China, and thence exported in considerable quantity to Japan and China, where it is much esteemed. It is transparent, and gives a consistence to soup. *Chinese Locksoy* is opaque, and less esteemed.—*Des. Comp.*

(8542) VERNANGU, the Tamil name of a Ceylon tree which is also named mast-wood. It is light, and is used by the natives for the masts and yards of small vessels. It grows to about twenty inches in diameter, and from twenty to forty feet in height. It produces a fruit or seed similar to that of the Peon.—*Edye, Ceylon.*

(8543) VERNICIA, a name applied by Loureiro to a Plant of Cochin-China, which is well known as yielding an oil, and which belongs to the same genus as another plant, also yielding an oil, in China and Japan. By Thunberg the latter plant was called *Dryandra*, but that name being appropriated to a genus of *Proteacea*, these oil-trees are now referred to the genus *Elæococca* of Commerson. This genus belongs to the natural order *Euphorbiaceæ*. *E. verrucosa* the *Dryandra oleifera* of Lamarck, and the *D. cordata* of Thunberg, is a native of Japan, where, he states, it is called Abrassin: the oil expressed from its seeds is used both as an article of diet and for affording light. The Chinese are said to call the oil Mouyeou, and the fruit from which it is obtained Mouyou. The tree cultivated in Bourbon is there called Arbre d'Huile, where an oil is likewise obtained by submitting the almonds of the seeds to pressure. *E. montana*, the *Vernicia montana* of Loureiro, is a native of China and Cochin-China: it yields a clear yellowish fatty oil, which is employed to protect wood from the influence of air and water. It is sometimes mixed with the real varnish of those countries, which it makes more liquid, but less valuable as a resin.—*Eng. Cyc.*

(8544) VERNONIA, named after W. Vernon, a genus of Plants belonging to the natural order *Compositæ*. *Vernonia* (*Serratula*, Roxb.) *anthelmintica* is a pretty, large, erect, annual species, common on dry uncultivated ground and rubbish in different parts of India, flowering during the cold season. The dark-coloured seeds are extremely bitter, and considered powerfully anthelmintic. They are also employed as an ingredient in compounds prescribed in snake-bites.—*Eng Cyc.* Dr. Wight gives Vernonia conyzoides, 829, 1376; multiflora, 1084; Neilgherrensis, 1078; pectiniformis, 1077; salviæfolia, 1072; and *Wightiana*, 1079.

(8545) VERNONIA ANTHELMINTICA, Purple Fleabane, Linn.

Caat Siragum, Tam.	Adivie Zeelacara, Tel.
Kalie Zeerie, Duk.	Kanana Zeeraka, Sans.

The Oil.

Wild cummin seed Oil, Eng.	Caat seeragum yennai, Tam.

The seeds are extremely bitter, small, and dark coloured. They are considered as powerfully anthelmintic, and are also an ingredient of a compound powder which is occasionally prescribed in cases of snake bites. Rheede tells us that an infusion of them is given on the Malabar coast, for coughs and in flatulencies. See Hort. Mal. part 2d. p. 40.—*Ains Mat. Med. p.* 74. Amongst new fibres appears a sample of Vernonia anthelmintica. It is rather hard but this may possibly be the result of bad cleaning. —*M. E. J. R.*

(8546) VERNONIACEÆ, a tribe of Plants belonging to the natural order *Compositæ*. They are distinguished from *Lactuces* by their corolla, which is not ligulate, and from every other tribe by their style, which is the same as that possessed by *Lactuceæ*. There are several genera of plants belonging to this tribe, which are chiefly inhabitants of America: there are a few in Asia and Africa, but none in Europe.—*Eng. Cyc.*

(8547) VERONICA, a genus of Plants belonging to the natural order *Scrophulariaceæ*. The species consist of herbs, undershrubs, or shrubs, with opposite, alternate, or verticillate leaves. The flowers are of a blue, white, or red colour and are arranged in spikes or racemes; calyx is campanulate or compressed, 4-5-parted; the corolla rotate, with a very short tube, a 4-parted spreading limb; all the segments entire, the upper one the broadest; the stamens are 2, situated at the sides of the upper segment of the corolla, diverging: anthers 2-celled; stigmas hardly thickened. The fruit a capsule, with a septum in the middle or bipartible. The species of the genus are exceedingly numerous; they are distributed over all parts of the world, and are

specially abundant in temperate climates. The flora of Great Britain contains about 20 species. —*Eng. Cyc.*

(8548) VERONICA. The species of this genus, are common pretty annuals, with blue flowers —cultivated in any good garden soil by seed, or division of the roots.—*Eng. Cyc.*

(8549) VERONICA BECCABUNGA. SPEEDWELL. A favourite popular remedy in Europe in coughs, chronic visceral affections, and dyspepsia. It contains a little tannic acid and mucilage, but no more remarkable ingredient. It is no longer employed in regular medical practice. —*O'Shaughnessy, p.* 478.

(8550) VERONICA OFFICINALIS. A similar plant, is officinal in the French Codex. There are several Indian species.—*O'Shaughnessy, page* 478.

(8551) VERONICA SPICATA, Spiked Speedwell, has its flowers on a spiked raceme.—*Eng. Cyc.*

(8552) VESPA MAGNIFICA, *Sm.* An enormous hornet nearly two inches long was brought to Dr. Hooker at Choongtam in Sikkim alive in a cleft-stick, lolling out its great thorn-like sting, from which drops of a milky poison distilled: its sting is said to produce fatal fevers in men and cattle, which may very well be the case, judging from that of a smaller kind, which left great pain in his hand for two days, while a feeling of numbness remained in the arm for several weeks. It is called "*Vok*" by the Lepchas the common name for any bee: its larvæ are said to be greedily eaten, as are those of various allied insects.—*Hooker, Him. Jour. Vol.* II. *p.* 26.

(8553) VESPIDÆ, a family of Insects belonging to the order *Hymenoptera*. It comprises the species of the genus *Vespa* of Linnæus, of which the common Wasp and the Hornet are familiar examples. They were formed into a family by Latreille, under the name of *Diploptera*, afterwards changed into *Diplopteryga* by Kirby. They form the third and last division of the first sub-section (*Prædones*), of the second section (*Aculeata*) of *Hymenoptera*, in Westwood's revision of Latreille's arrangement. When at rest they fold their wings throughout their entire length, whence their distinctive appellation. The wings of all the insects of the family have a similar neuration, their eyes are lunate, and there are glands at the extremity of the labrum. The four wings have one marginal and three perfect submarginal cells, with an incomplete terminal submarginal cell. Among the Wasps are insects of the most dissimilar habits; some solitary, others living in societies, some phytophagous others carnivorous. Such as are social rival the bees in the complicated instincts which regulate their societies. At first sight these great differences of manners would seem to point to a classification superior to that founded on such unimportant characters as the folding of the wings, &c. But when we find on further inquiry that the latter apparently insignificant distinctions correspond to essential modifications of structure common to all the insects of the family, we are led to conclude that among the Wasps, structure, and not economy, is the real source of essential character.

The Solitary Wasps, each species of which comprises males and females only, constitute the family *Eumenidæ*. The genera *Eumenes* and *Odynerus* belong to it. The habits of the Solitary Wasps are intersting. Reaumur informs us that the *Odynerus murarius* (*Vespa muraria*) of Linnæus makes a hole several inches deep in the sand, or in the sides of walls, constructing a tube of earthy paste, at first straight, and then curved at its entrance. In this burrow it constructs its cells, and deposits in the cavity of the interior cell from 8 to 12 little green caterpillars arranging them spirally in layers above each other. In the midst of these it deposits its eggs, then closes the mouth of the hole with the materials of the tube, which it had used as a sort of scaffold. The larvæ when hatched feed upon the caterpillars. The Social Wasps constitute the restricted family of *Vespidæ* of Westwood, the *Polistides* of Saint Fargeau. They live in numerous societies, consisting of males, females, and neuters, which are temporary, being dissolved at the approach of winter. The mandibles of the *Vespidæ* proper are not longer than broad, and are broadly and obliquely truncated at their extremities.—*Eng. Cyc.*

(8554) VIBURNUM, a genus of plants belonging to the natural order *Caprifoliaceæ*. The species consist of shrubs with opposite petiolate leaves and corymbose flowers. The limb of the calyx is 5-cleft, permanent; the corolla rotate, subcampanulate, and tubular; the fruit a berry, ovate or globose, with 1 seed by abortion, and crowned by the calycine teeth. The species are natives of Europe, America, and Asia, and are of easy culture in British gardens. Some of them were known to the Greeks and Romans, though the species have not been always identified.—*Eng. Cyc.* All the varieties of Laurustinus are hardy shrubs, are evergreen, and bear the climate of Great Britain well; most of them blossom from November till April, and sometimes during May and June.—*Eng. Cyc.* Dr. Wight gives Virburnum acuminatum, 1021; capitellatum, 1022; hebanthum, 1023; *lantana*, 1024; *opulus*, 1024; Wightianum, 1024.

(8555) VIBURNUM PLICATUM, and *V. macrocephalum* two gorgeous Chinese plants were sent to Chiswick in 845.—*Fortune's Tea districts, page* 17.

(8556) VICIA, a genus of Plants belonging to the natural order *Leguminosæ*. The species are usually climbing herbs with abruptly pinnate leaves, with many pairs of leaflets; the common petiole terminating in a tendril at the apex,

which is mostly branched; the stipules are semi sagittate in form, and the peduncles axillary, 1- or many-flowered; the calyx is tubular, 5-cleft or 5-toothed, the two upper teeth shortest; the corolla papilionaceous: the stamens diadelphous; the style filiform, being at right angles with the ovary, villous on the upper side, and on the under side beneath the apex; the legume 1-celled, many-seeded, oblong; the seeds with a lateral oval or linear hilum. The species of this genus are very numerous.—*Eng. Cyc.*

(8557) VICIA BIENNIS, Biennial Vetch, has about 12 lanceolate glabrous leaflets.

(8558) VICIA BITHYNICA, Rough Podded Purple Vetch, has stalked mostly solitary flowers.—*Eng. Cyc.*

(8559) VICIA CRACCA, Tufted Vetch.

(8560) VICIA LUTEA, Rough-Podded Yellow Vetch, has sessile solitary flowers.

(8561) VICIA PISIFORMIS, Pea-like Vetch is a quite smooth plant

(8562) VICIA SATIVA, common Vetch, or Tare, has leaves with tendrils.

(8563) VICIA SEPIUM, Bush-Vetch, has flowers mostly in fours, somewhat stalked.

(8564) VICIA SYLVATICA, the Wood Vetch, has many flowered peduncles longer than the leaves

(8565) VICOA, a genus of Plants belonging to the natural order *Compositæ*, and sub-tribe *Inuleæ*.—*Eng. Cyc.* Dr Wight gives Vicoa Indica, 1148

(8566) VICTORIA REGIA. NYMPHÆACEÆ.—"This beautiful water lily has been successfully raised in the Botanical garden at Calcutta from seed sent by Dr. Wallich from England on the 9th of September 1851. It was received and sown in the garden on the 6th of November following, where it lay in a dormant state until the 23d of April 1853. On the 13th of May same year, the seedling had made a healthy growth and was transferred on that date to the mound prepared for it in the tank. The largest leaf when planted out was little more than three inches in diameter. The total number of leaves produced up to the 5th of September were forty-four, fifteen of which were on the plant in different stages of development, when the first flower had made its appearance on the surface of the water, the largest leaf produced up to that time measured 4 feet 5½ inches in diameter. The first flower-bud appeared partly above the water on the morning of the 6th September and by sunset the same evening had partly expanded the flower which closed up the next morning, and finally opened again at sun-set the same evening."—*Journal of the Agri Horticultural Society, Cal. Vol.* 8, 1853. *Riddell.*

(8567) VILLARSIA, a genus of Plants belonging to the natural order *Gentianaceæ*, named after Villars, a French botanist. It has a 5-parted calyx: a subrotate corolla with spreading limb, the segments with a flat disc; 2-lobed stigmas, the lobes toothed; 5 hypogynous glands; a 1-celled 2-valved or valveless capsule; seeds naked, or girted with a membranous margin. There are about 16 species of this genus. These are either aquatic or marsh plants, with alternate entire leaves and yellow flowers. They are inhabitants of all parts of the world. One only is a native of Europe—*Eng Cyc.*

(8568) VILLARSIA INDICA, aristata, and nymphæoides occur in every part of India, and afford a good bitter.—*O'Sh. p.* 450.

(8569) VILLARSIA NYMPHÆOIDES, Nymphæa-like Villarsia, is a floating plant, with orbicular-cordate leaves; the peduncles single-flowered, and aggregate; the segments of the corolla ciliate. It is a native of Denmark, Holland, Sweden, Germany, Piedmont, and of Siberia. It is found in ditches and slow-running streams. It is also a native of Great Britain, though compratively a rare plant. It is found in the Thames, in the recesses of the shores near Waltom Bridge, near Botley Bridge, Godstow Bridge, and Hinksey Ferry. It occurs also in the fens of Lincolnshire and in Yorkshire. It is a beautiful plant, and may be easily cultivated. It has a large yellow flower, which is curiously plaited. It is a very abundant plant in Holland, frequently covering large tracts of the canals with its beautiful yellow flowers and dark-green leaves. —*Eng. Cyc. Vellarsia Nymphæoides* grows in every part of Hindoostan; in Cashmere it vegetates on the lakes, and is given, as food, to cows, in the belief that it increases their milk.—*Thirty five years in the East by Dr. Honig. p.* 364.

(8570) VINCA (from 'vinco,' to bind), a genus of Plants belonging to the natural order *Apocynaceæ*. It has a salver-shaped corolla, with the tube longer than the calyx, and the throat bearded; the segments of the limb flat, oblique, 5-lobed, truncate at the apex; 5 stamens inserted in the throat inclosed with short filaments. Five or six species of this genus have been described; they are creeping, suffruticose, or herbaceous plants, with smooth shining opposite leaves, with blue, purple, or white flowers, seated on solitary axillary alternate peduncles. They are natives of Europe, in shady places.—*Eng. Cyc.*

(8571) VINCA MAJOR, Greater Periwinkle. Its flowers are of a fine purple-blue colour, and are larger than those of any other species. The English name, Periwinkle, seems to be derived from the French, Pervenche. In Chaucer's time it was called Perwinke:—

> "There sprang the violet al newe,
> And fresh perwinke rich of hewe."

In olden times great virtues were attributed to the Periwinkle; amongst other things, Cul-

pepper says, "the leaves of the Periwinkle eaten by man and wife together do cause love between them." In Italy this plant is called Fiore di Morte, from the practice of making garlands of it in sorceries and incantations, hence the French still call it Violette does Sorciers.—*Eng. Cyc.*

(8572) VINCA MINOR, Lesser Periwinkle, has procumbent stems; the flowering stems usually erect. It is a native of Europe, in the same situations as the last, and is often found in Great Britain.

(8573) VINCA PUSILLA. *Syn.* V. parviflora. Roxb. Fl. Ind. ii. p. 1. Common in the East Indies. A small erect annual, stem smooth. Applied in India as an external stimulant in lumbago. *Royle.—O'Shaughnessy, p.* 448.

(8574) VINEGAR.

Khull, ARAB.	Chooka, MAL.

Acetum, LAT.	

Is an impure Acetic Acid, of which several varieties are known in commerce, such as, wine, malt, sugar, toddy &c., vinegar. It is extensively employed for pickling, in domestic cookery &c.—*Faulkner*. Acetic Acid is the volatile principle to the presence of which, diluted with variable proportions of water, vinegar owes its aroma and pungency. This acid exists, ready formed, in notable quantity in certain plants, as Sambucus niger or black elder Phœnix dactylifera or Date tree, and Rhus typhenus. It may be readily generated by the fermentation of various vegetable and animal substances, especially the former. For commercial purposes it is made from certain vegetable and spirituous infusions, as those of the grape, malt, and the sugar cane; but any vegetable infusion capable of yielding alcohol will also, when exposed to the necessary conditions furnish vinegar. In most cases, and indeed whenever vinegar is manufactured on a large scale, and the vinous or alcoholic fermentation precedes the acetous the vinegar is formed entirely at the expense of the alcohol. But the conversion of alcohol into acetic acid it is said, ought not to be regarded as essential to acetification, since some vegetable and animal infusions become sour, from the formation of acetic acid, without any previous generation of alcohol. Acetic acid may be formed directly from the vapour of crude alcohol or spirits of wine in communication with the atmosphere, through either an ignited platinum wire, or by means of the black powder obtained by boiling protochlorine of platinum and potash with the alcohol. In Germany where the price of alcohol is very low, vinegar has been manufactured on a large scale on this principle.

The process is thus described by Dr. Ure. Under a large case, which for experimental purposes may be made of glass, several saucer-shaped dishes of pottery or wood are to be placed in rows upon shelves over each other, a few inches apart. A portion of the black platina powder, moistened, being suspended over each dish, let as much vinous spirits be put into them as the oxygen of the included air shall be adequate to acidify. This quantity may be inferred from the fact that 1000 cubic inches of air can oxygenate 110 grains of absolute alcohol, converting them into 122 grains of absolute acetic acid, and sixty four grains and a half of water. The above simple apparatus is to be set in a light place (in sunshine if convenient), at a temperature of from 68° to 86° Fahr, and the evaporation of the alcohol is to be promoted by hanging several leaves of porous paper in the case, with the bottom edges dipped in the spirit. In the course of a few minutes a most interesting phenomenon will be perceived. The mutual action of the platina and the alcohol will be displayed by an increase of temperature and a generation of acid vapours which condensing on the sides of the glass case, trickle in streams to the bottom. This striking transformation continues till all the oxygen of the air be consumed. If we wish then to renew the process we must open the case for a little and replenish it with air. With a box of twelve cubic feet in capacity and with a provision of seven or eight ounces of platina powder, we can in the course of a day convert one pint of alcohol into pure acetic acid, fit for every purpose culinary or chemical with from twenty to thirty of the platina powder, which does not waste, we may transform daily nearly 300 pounds of bad spirits into the finest vinegar. Though English revenue laws preclude the adoption of this elegant process upon the manufacturing scale in that country it may be regarded as one of the greatest triumphs of chemistry where art has rivalled nature in one of her most mysterious operations. It is therefore evident that much of the success of any process adopted for the manufacture of vinegar will depend upon the manner in which the mother liquor is exposed to the atmosphere, that is upon the constant renewal of the air and the extent of surface exposed to its action the conversion of alcohol into acetic acid taking place only on the surface of the liquid. The knowledge of the fact that atmospheric air is indispensable to acetification explains why wine and beer which when inclosed in air-tight vessels undergo no change as soon as they are exposed to the air rapidly pass into the acetous fermentation. A second necessary condition is the presence of a substance capable of exciting fermentation, that is a ferment. In vegetable infusions as those of the grape and malt, the nitrogenised principles contained in them chiefly gluten, act as the fer-

ment. Vinegar itself, vinegar yeast, lees beer yeast, leavened bread, and many other similar matters all of which contain gluten are capable of exciting fermentation and so promoting the generation of acetic acid. Experience has shown that the best ferment for inducing the transformation of alcohol into acetic acid is a portion of ready-made vinegar itself. A third condition which though not like the former essential yet greatly hastens the conversion is an increased temperature varying considerably in different cases but sometimes reaching as high as 100 Fahr. When any spirtuous liquor is exposed under the conditions requisite for acetification the following phenomena are observed to occur in succession. However clear the liquid may have been at first it quickly becomes turbid, currents or movements are soon visible in it, it is said in common language to be on the work. Slimy particles collect on the surface gradually forming a scum and which after a time falls as a sediment to the bottom. The Germans call this scum, vinegar mother, since it is capable of exciting acetification in fresh portions of liquid. During the process the temperature of the liquid rises and the peculiar aroma of vinegar becomes diffused in the surrounding air. As soon as all the alcohol has become converted into acetic acid the temperature falls to that of the atmosphere, the motion ceases, the liquid becomes clear and bright and its conversion into vinegar is complete. The four principal kinds of vinegar met with in commerce are wine vinegar, malt vinegar, sugar vinegar, and wood vinegar. The first three of these depend upon fermentation and result from the change of alcohol into acetic acid, while wood vinegar is obtained without the intervention of fermentation by the destructive distillation of wood. The principal adulterations of vinegar are, Dilution with water, the addition of sulphuric acid, the substitution of pyroligneous for acetic acid, the use of burnt sugar as a colouring agent, and occasionally the addition of acrid substances as chillies and grains of Paradise. The presence of sulphuric acid in British vinegar is not in itself to be regarded as an adulteration, since the addition of one part to a thousand is permitted by law. It is only when the quantity present exceeds this that it is to be considered as constituting an injurious and illegal adulteration. Dr. Hassall found,

1st. That the amount of acetic acid, the most important constituent of vinegar, varies greatly in different samples, the highest per-centage being 5.10 and the lowest 2.29 or less than half the first amount.

2nd. That since the standard No. 24 vinegars submitted to analysis range for the most part considerably over four per cent, vinegar to be deemed good ought to contain certainly not less than four per cent of real acid.—*Food and its adulterations, p.* 368.

(8575) *Acetum*, L. Acetum Gallicum, E. Acetum Vini, D. Vinegar, L. French or Wine Vinegar. E. D. Though the L. C. does not distinguish Foreign from British Vinegar, yet as by their tests thay required only pure Vinegar to be used, it may treated of with the Foreign Vinegar.

L. Yellowish; of a peculiar odour; f ʒ 1 saturates *Carbonate of Soda* gr. lx. and *Sol. Chloride of Barium* produces in this quantity not above 1·14 gr. of Sulph. of Baryta. Its colour is not altered by Sulphuretted Hydrogen. the Sulphate of Baryta is equivalent to the quantity of Sul. (1 part in 1000) which is allowed by the excise laws to be added. The Sulph. Hydrogen will indicate the presence of Lead. The colour and odour are indications of purity, and the Soda will prove its strength. Wine Vinegar, according to the E. P., has a Sp. Gr. of 1.014 to 1.022 Ammonia in slight excess causes a purplish muddiness, and slowly a purplish precipitate. In f ʒ iv. complete precipitation takes place of all the Sulphuric acid present with *Sol. of Nitrate of Baryta* ♏ xxx. E.

(8576) *Acetum Brittanicum*, E. British Vinegar. British Vinegars are usually much paler, but sometimes much darker, from the presence of extractive and other matters, than the White Wine Vinegar, and are deficient in aroma. They often contain a much larger than the recognised proportion of Sulphuric acid, besides some Lime. The E. P. gives as tests of its being sufficiently pure, that it has a Sp. Gr. of 1·006 to 1·0019. Sulphuretted Hydrogen does not colour it; complete precipitation takes place in f ʒ iv. with *Sol. of Nitrate of Baryta* ♏ xxx.

(8577) *Acetum Distillatum*, L. E. D. Distilled Vinegar. *Prep.* Take of *Vinegar* (French by preference, E.) Cj. (10 parts, D.), distil in a glass retort, from a sand-bath, and into a glass receiver, Ovij. (Dilute the product if necessary with *Aq. dist.* till the Sp. Gr. is 1·005, E. Reject the first tenth, and preserve the next seven-tenths, of which the Sp. Gr. is 1·005. D. By distillation, the Colouring Matter, Sulphuric acid and other impurities, being left behind, the Vinegar becomes a colourless diluted Acetic Acid, and used to be called Acetous Acid. With the acid and water rises a little of the Mucilage, and also the Ethero-Spirituous substance (or Acetic Ether ?), which characterizes all good Vinegar, and is the source of its peculiar aroma, that is, if the first part has not been unnecessarily rejected. The odour and taste of the distilled are less agreeable than that of good Vinegar.

L. "It should be entirely dissipated by heat. Nothing should be precipitated from it on the addition of Acetate of Lead, or Nitrate of Silver, or Iodide of Potassium (showing the absence of Sul and H Cl, as well as of Lead). Neither

Sulphuretted Hydrogen nor Ammonia alter its colour (showing absence both of Lead and of Copper). Silver being digested with it, nothing is precipitated on the addition of H Cl (showing absence of Ni'). 100 grs saturate Carb. of Soda grs. xiij (100 minims saturate grs. viij. Sp Gr. 1·005, E.) The Sp. Gr. of the L. distilled Vinegar is 1·007 or upwards, according to Dr. Christison. The E. C. order dilution because distilled Vinegar is often above 1·005. Vinegar of India is made from the sediment of Toddy, and is coloured artificially. The juice of the *Gomuti palm, Arenga saccharifera*, put into a jar for five days, is converted into excellent vinegar, equal in strength to that produced by the vinous fermentation of Europe. Large quantities of the palmyra toddy is converted into vinegar, in Ceylon, and used for pickling gherkins, limes, the undeveloped leaves of the Cocoa-nut and palmyra trees, and other substances.—*Royle.*

(8578) VIOLA, a genus of Plants, the type of the natural order *Violaceæ*. The sepals are unequal, 5, all more or less drawn out downwards into ear-like appendages, erect after flowering; petals 5, unequal, convolute in æstivation, with 3-nerved claws, the lower one drawn downwards into a hollow spur; stamens 5, approximate or coaretate, inserted on the top of the teeth or a pentagonal 5-toothed torus; the filaments dilated at the base, oblong or triangular, bearing the anthers low down; lobes of anthers spreading at the base; the two anterior stamens bearing on their back two nectariferous lancet shaped round or linear appendages, which are drawn within the spur. The species of this genus are exceedingly numerous.—*Eng. Cyc.* Dr. Wight gives Viola odorata, 943; Wightiana, 943; (P.) glaucesens, 1825.

(8579) VIOLACEÆ, *Violet-Worts*, a natural order of Exogenous Plants. It has the following essential characters:—Sepals 5, persistent, with an imbricate æstivation, usually elongated at the base. Petals 5, hypogynous, equal or unequal, usually withering, and with an obliquely convolute æstivation. Stamens 5, alternate, with the petals occasionally opposite them, inserted on a hypogynous disc, often unequal; anthers bilocular, bursting inwards, either separate or cohering, and lying close upon the ovary; filaments dilated, elongated beyond the anthers; two in the irregular flowers, generally furnished with an appendage or gland at their base. Ovary 1-celled, many-seeded, or rarely 1-seeded, with 3 parietal placentæ opposite the three outer sepals; style single, usually declinate, with an oblique hooded stigma. Capsule of 3 valves, bearing the placentæ in their axis. Seeds often with a tumour at their base; embryo straight erect in the axis of fleshy albumen. (Lindley.) The species are herbs, undershrubs, or shrubs with alternate rarely opposite leaves, simple, usually involute before expansion, and all furnished with stipules. The flowers are erect or drooping, axillary, seated on peduncles, which are 1-flowered, solitary, or numerous, sometimes branched.

Violaceæ are related to *Polygalaceæ*, *Dorseraceæ*, and *Passifloraceæ*. The order is divided into two tribes, *Violeæ* and *Alsodineæ*. The former chiefly inhabit Europe and America; the latter, with the exception of the genus *Pentaloba*, are natives of South America and Africa. This order embraces 11 genera and 100 species.

All the *Violaceæ* possess in a greater or less degree emetic properties, which reside principally in their roots; the principal on which this property seems to depend has been separated by Boullay from some species of *Viola*, and has been called Violina. *Viola odorata* is admitted into the Edinburgh and Dublin Pharmacopœias for the purpose of making a syrup of the flowers.

(8580) VIOLA ODORATA. Banopsha. The plant in the dry state is sold in the bazars, and is prescribed in infusion by the Hakims as a diaphoretic in the treatment of fever. It nauseates slightly, owing to its containing a very minute quantity of the principle termed *violina*, closely resembling the emetine, on which depend the virtues of the ipechacuana of Brazil. The Viola odorata, as sold in the bazar, has dry, thready, fibrous roots, a pale yellow colour, knotty, some as thick as a quill. The leaves are heart-shaped; flowers blue. The entire plant retains slightly the delightfully sweet smell characteristic of this tribe. Under the name of Begbanopsha, or violet root, and having precisely the smell of the fresh flower of our article, is sold in the bazar the well-known "orris root" or Iris florentiana. Excellent issue peas are made from this root. To obtain violina the alcoholic extract of the plant is treated with ether to dissolve some fatty and green colouring matter. The residue is boiled in water, acidulated with sulphuric acid, and the solution is precipitated by hydrated oxide of lead. The precipitate contains *violina* and oxide of lead. The mixture boiled with alcohol, and the solution evaporated, yields the violina as a pale yellow matter, which may be rendered white by washing with cold strong alcohol. The root of this violet separated from the plant and reduced to powder, proves emetic in doses of from two to four drachms made into a decoction by boiling water. The emetic operation is preceded by much nausea, and is often followed by purging. Dr. O'Shaughnessy's experience on the whole leads him to prefer as an emetic the *Crinum toxicarium*, previously described. The infusion of one drachm of the root in half a pint of water, is a very good nauseant and diaphoretic. He did not succeed in his attempt to substitute the violet root or ipecacuanha in the preparation of Dover's powder, or of Twining's antidysenteric pills. Several species of violet possess similar

properties. Royle has figured three Himalayan species, V. serpens, V. reniformis, and V. kunawurensis, the first of which is found in Mussooree, the second on the Choor mountain, the last in Kunawur.—*O'Shaughnessy, page* 208. Sweet scented violet requires a good rich soil, shelter from the sun and plenty of water, succeeds at Madras and flowers freely. Plants to be had on the Neilghery Hills. —*Jaffrey. Viole Odorata,* becomes quite acclimated in the Deccan, they are best grown in pots, and require to be moderately shaded, the morning sun being sufficient for them: the plants must be protected from the hot winds, and divided out into small bunches when transplanted. The white violet is not known in the Southern part of India, but in England the finest are generally found in calcareous soils; in India the violet seldom blossoms if grown in garden beds.—*Riddell. Viola Odorata,* Common Sweet Violet, has no stem; a hooked naked stigma; crenated smoothish roundish-cordate leaves; ovate obtuse sepals, the two lateral petals with a hairy line; the spur very blunt; the capsules turgid, hairy; seeds turbinate, whitish; the stoles creeping, long, rooting. This plant is a native throughout the whole of Europe, and in Siberia and China. It is common in England, but is a rare plant in Scotland and Ireland. Wherever this plant grows its delicious scent has made it a great favourite.—*Eng. Cyc.*

(8581) *V. Hirta,* the Hairy Violet.
(8582) *V. Canina,* Dog's Violet.
(8583) *V. Palustris,* the Marsh Violet.
(8584) *V. Lactea,* Cream-Coloured Violet.
(8585) *V. Tricolor,* Three-Coloured Violet, Heart's-Ease, or Pansy.

(8586) *V. Lutea,* Yellow Mountain Violet, or Yellow Pansy.

In the following table the distribution of 75 species, according to the form of their nectaries, is exhibited:—

Nectaries.	Europe.	Asia.	Africa.	America: North.	America: South.	Australia.	Total.
Lancet Shaped.	19	4	1	22	1	1	48
Rotund . . .	2	0	0	1	0	1	4
Linear. . . .	12	4	1	6	0	0	23

(8587) VIOLA TRICOLOR, HEARTSEASE or PANSY. The flowers of this species of violet vary much in size, some only are odorous. The colours are, as its name indicates, mixed and numerous, being from deep purple and yellow, to blue and white, crimson, &c. They are not so common in India as the Viola Odorata, although easily raised from seed which is chiefly procured from Europe.

Propagation.—By seeds and cuttings. In Europe this flower has been brought to great perfection from the mode of continual offsets. The flowers are not generally scented, but some are found so on the Neilgherry Hills. The seed should be taken as soon as the seed vessels appear round and full; they may be dried in the house and the seed preserved; if left on the plant the capsules dry and open of themselves, fresh plants springing up from the seed that drops out. Requires a light loamy vegetable soil.—*Riddell.*

(8588) VIPENIE, the Tamil name of a Ceylon tree which grows to fourteen inches in diameter, and from twelve to fifteen feet high. It is used for boat-work and house furniture. —*Edye. Ceylon.*

(8589) VIREY, the Tamil name of a Ceylon tree which grows to about twenty inches in diameter, and twelve feet high. This is very handsome, hard wood. It produces a kind of seed which is very mealy, and which the poorer classes of the natives eat as a substitute for rice. —*Edye. Ceylon.*

(8590) VIROLA SEBIFERA, a large tree of Guyana, which belongs properly to the genus *Myristica,* and is in fact by some called Nutmeg of Cayenne, and has the same properties as many of the other species of that genus. When incisions are made into the bark, a reddish glutinous juice exudes, which, when fresh, is used as a caustic, and which concentrates in time. The mace is of a red colour, and within it the kernel is of a whitish colour, which, when powdered and put into boiling water, yields a yellowish-coloured fatty substance which swims on the surface; it is caustic in taste, and has a slight odour of nutmeg. In the country candles are made of it; hence Europeans call the tree Porte Suif.—*Eng. Cyc.*

(8591) VISCUM, a genus of Parasitical Plants belonging to the natural order *Loranthaceæ,* of which one species is found wild in England. *V. album,* the Mistletoe, is in many respects a production of great interest to the physiologist. The seeds in germination seem to offer an exception to a general law, that the radicle of the embryo shoots downwards, and the plumule upwards; for it is found that the radicle of the Mistletoe invariably turns itself down upon the body to which it is attached, whatever may be the position of the surface of that body with respect to the earth. For instance, if a cannon ball, to which mistletoe-seeds are glued on all sides, be suspended by a cord some distance from the earth, both the upper and under seeds, as well as those at the sides, all direct their radicle to the surface of the ball. This property ensures their growing upon the branches of trees, to whatever side they may happen to stick. In fixing itself upon a branch, the embryo of the Mistletoe curves its radicle down upon the bark, and then adheres firmly to it, and it is a twelvemonth before the plumule begins to extend; this may be to give the radicle time to pierce the bark and introduce itself below the liber, where it expands and acts

the part of a root by attracting thence the fluids which are necessary for the support of the parasite. It is not a little remarkable that in the structure of its ovary this plant, and others of its order, should offer the singular fact of the ovule not existing at the time of impregnation, nor appearing till from six weeks to two months later. The fruit, which is covered with a viscid pulp, is made by the Italians, and even in Herefordshire, into a kind of birdlime; and as it is a favourite food of the large or Missel Thrush, it is thought to have given rise to the proverb; 'Turdus malum sibi cacat.' The plant is not of any known use to man, and is of popular interest chiefly as having been connected with Druidical superstitions. The Mistletoe of the Druids was exclusively that found upon the oak, and was possibly so much valued because of its rarity; for its appearance on that tree is now so rare, that many persons have believed the Mistletoe of the Druids either to have been some other plant or to have had no real existence. Dr Wight gives Viscum B coralloides, 1019; moniliforme, 1018; orbiculatum, 1016; ramosissimum, 1017.

(8592) VISCUM MONOICUM. No medicinal properties of any importance had been observed in the natural order of plants the Loranthaceæ until it was accidentally discovered in 1836, that the Viscum found on the nux vomica trees of Cuttack possessed all the properties of the supporting tree. As the occurrence attracted attention, and was of considerable interest in botanical physiology, the particulars in detail are as follows; In 1837, Lieut. Kittoe, then with his regiment at Cuttack, received information of the existence of a parasite on the nux vomica trees, to which extraordinary medicinal powers were attributed by the natives. They called it *Kuchila ke mulung*, held it to be an extremely powerful *narcotic*, and poisonous in small doses, and they used it in the treatment of agues and rheumatism. Mr. Kittoe having procured specimens of the leaves sent them to Dr. O'Shaughnessy, for experiment. Given in three grain doses to dogs and kids, tetanic spasms set in, in the course of from five minutes to a quarter of an hour, recurring at intervals, and proving fatal by fixing the diaphragm, and causing asphyxia.—*O'Sh. p.* 375.

(8593) VISENIA UMBELLATA. A considerable tree of great beauty, with rose coloured flowers and velvetty leaves; introduced from Sumatra, the seeds having been sent to the Horticultural Society's Garden, by Dr. Wallich.—*M. E. J. R.*

(8594) VITEX, a genus of Plants belonging to the natural order *Verbenaceæ*. It has a short campanulate 5-toothed calyx. The corolla is irregular, somewhat labiate, divided into 5 lobes. Stamens 4, didynamous, inserted into the corolla. Ovary superior, roundish; style the length of the stamens; 2-pointed and diverging stigmas The fruit is a globular berry, a little hard, with its base covered by the calyx, and divided into four single-seeded cells.—*Eng. Cyc.* Dr. Wight gives Vitex altissima, 1466; *arborea*, 1465; leucoxylon, 1467; negundo, 516; pubescens, 1465.

(8595) VITEX AGNUS CASTUS. The seeds are inodorous when entire, but when bruised their odour is acrid and disagreeable. The taste acrid and pepperish, very persistent. They are very rich in essential oil, and possess powerful stimulating properties. At Smyrna the powder strewed over sliced onion and applied to the stomach is deemed a certain remedy in colic (*Lindley*) —*O'Shaughnessy. page.* 485. In the month of February, in the tropical region below Darjeling the air is scented with the white blossoms of the *Vitex agnus castus*, which grows in profusion by the road-side.—*Hooker, Him. Jour page.* 374. *Vitex Agnus-Castus* is the longest-known species, and a native of the south of Europe, has digitate leaves of 5 or 7 nearly entire leaflets, something resembling those of the hemp-plants, and it forms a shrub of about 12 feet in height. The flowers are arranged in spiked whorls, and have an agreeable fragrance. The fruit is globular, rather smaller than black pepper, with an acrid and aromatic taste, whence it is called Petit Poivre Sauvage in the south of France. It was well known to the ancients, and forms the *Piper agrestis* of some authors. In India the fruits of the species *V. triphylla* and *V. Negundo*, which are indigenous there, have the same properties ascribed to them, and are called Filfil Burree (Wild Pepper). The ancients considered the *Vitex* anti-aphrodisiac, but the berries, from their warm aromatic taste, must be possessed rather of stimulant properties.

(8596) VITEX ALATA. A small tree found in the Naggary Hills, leaves ternate, petioles winged.—*M. E. J. R.*

(8597) VITEX ALTISSIMA. MAGELLOO.
Kat miella, TAMIL.

A large tree of great beauty, when in flower, frequent on the slopes of the Western Ghauts, reported to be fit for cabinet purposes.—*M. E. J. R. of* 1855. It is thus described by Dr. Wight. "This is a large tree frequent on "the lower slopes of the ghaut mountains, but "I am not acquainted with the timber except in "so far as can be learned from a small outside "specimen which seems close grained. It is re-"ported fit for cabinet purposes." It would be desirable to learn more of this tree. A specimen formerly grew in Dr. Anderson's garden near the College bridge in Madras. Roxburgh describes the wood of one of its congeners V. arborea, common in the Northern Circars, as of a chocolate color, when old, exceedingly hard and durable.—*M. E. J. R. of* 1857.

(8598) VITEX ARBOREA.
Boosi, TEL.

A native of the mountainous parts of the Circars,

Chittagong &c. where it grows to be a very large tree, flowering time the hot season: the seed ripens during the rains. The wood of this tree when old is of a chocolate colour exceedingly hard and durable which renders it useful for various purposes (Roxb.)—*Rohde M S.S.* This species of vitex is very common at Maulmain, and produces a valuable small timber. Roxburgh says: "Wood when old, chocolate coloured, very hard, and durable."

(8599) VITEX LEUCOXYLON.

Karril, RHEED.

A native of Ceylon, Coromandel and the mountains of Chittagong, flowering time April.—*Rhode, M.S.S.*

(8600) VITEX NEGUNDO.

Noochie, TAM.	Nisinda, HIND.
Nergundi, BENG.	Wayalakoo, TEL.
Shumbali DUK.	Sinduya. and
Fenjengisht, ARAB.	Sindhooka. SANS.

In India a decoction of the aromatic leaves is used as the warm bath for women after delivery. (*Roxb.*) In medicinal qualities it is similar to, but weaker than V. Agnus castus. The decoction of the root is a pleasant bitter and is given in cases of intermittent fever. The warm leaves are stated by Mr. Sherwood to be a useful application in rheumatism or sprains. The Mahomedans are in the habit of smoking the dried leaves in cases of head-ache and catarrh. Fruit considered vermifuge in Behar.—*O'Shaughnessy, page* 435.

(8601) VITEX, *Species.* A tree of considerable size, a native of the forests in the interior parts of Coromandel.—*Rohde, M.S.S.*

(8602) VITEX TRIFOLIA. Roxb. Fl. Ind. iii. p. 69.

Neer nochie, TAM.	Neela vavilie, TEL.
Panee ke shumbalie, DUK.	Caranosi, RHEEDE.
Ussel ke abee. ARAB.	Jala nergundi and Sinduvara, SANS.
Nisindha also Seduaree, HIND.	Neergoonda. DUK.

Young shoots round and villous. Leaves slightly bitter, but of delightfully aromatic taste and smell; are deemed powerful external applications in rheumatism, sprains, &c. The powdered leaves are said to cure intermittent fevers. The fruit in powder is given usually in electuary, or decoction, for amenorrhœa and several other diseases. It is a common Indian plant. Sir William Jones in the 4th vol. Asiatic Researches, p. 293, states that the leaves are used to stuff pillows, to cure catarrh and headache. The flowers, according to Dr. Hamilton, are prescribed in Behar with honey in fevers attended with vomiting and much thirst (*Ainslie*, ii. p. 238.)—*O'Shaughnessy, page* 484. This in the Deckhan is a common shrub with pretty blue flowers, generally to be met with growing in patches, in moist places appearing in April and May, but more or less throughout the year. *Riddell* The chaste tree, is a shrub much cultivated by the Burmans, it bears a handsome little blue flower. Both leaves and flowers are "rather agreeably heavy scented."—*Mason.*

(8603) VITIS, a genus of Plants, the type of the natural order *Vitaceæ*. It possesses the following characters:—Calyx usually 5-toothed; petals 5, cohering at the top, resembling a calyptra, separating at the base and deciduous; 5 stamens; style none; berry 2-celled, 4-seeded; cells and seeds often abortive. The species are climbing shrubs, with simple lobed, cut or toothed, rarely compound leaves, the thyrsoid racemes of small greenish-yellow flowers. They are found principally in Asia and America. The best known of the species of *Vitis*, and perhaps one of the most extensively cultivated and useful of plants, is the *V. vinifera*, the Common Vine or grape-Vine. It is characterised among the other species by possessing lobed, sinuately-tooth, naked or downy leaves. A multitude of varieties of this plant have been recorded, both occurring wild and resulting from its very extensive cultivation.

Like most extensively cultivated plants, it is very difficult to ascertain of what country the vine is originally a native. It is among the plants of which we have the earliest records in the books of Moses, and from which it appears to have been made use of in the same manner as at the present day. Although the vine is found in many places wild, it may still be doubted whether it is indigenous there, on account of its frequent cultivation. There can be little doubt of its being truly indigenous in the East, in the district between the Black and Caspian seas. In the forests of Mingrelia and Imiretia it flourishes in all its magnificence, climbing to the tops of the highest trees, and bearing bunches of fruit of delicious flavour. In these districts no cultivation of the vine exists, and the inhabitants seldom harvest the abundance of fruit that is produced. In many spots in France, Germany, Portugal, and Italy, the vine is found wild, but the fruit is very generally of an inferior kind, and it may be doubted whether it is truly indigenous in any parts of Europe.

The cultivation of the vine extends from near 55° N. lat. to the equator, but in south latitudes it only extends as far south as 40°. It is cultivated at various elevations. In middle Germany it ceases from about 1000 to 1500 feet above the level of the sea. On the south side of the Alps it reaches 2000 feet; in the Apennines and Sicily 5000 feet; and on the Himalayas as high as 10,000 feet above the level of the sea. The point of the greatest importance in the ripening of the fruit of the vine is the length of the summer. Thus, although the maximum of summer heat is as great at Moscow as in Paris, yet the vine will not ripen its fruit in the former place, and this arises from the fact that although the greatest

heat of the months of June and July are as great as that of Paris, the months of August and September are several degrees below. Nor will the mean temperature serve as a rule to indicate where the vine may be cultivated. England has a mean temperature as high as many parts of the world, where the vine flourishes in the greatest perfection; but it will be found that although England is warmer than these countries in the winter, it is not so warm in the months of September and October, at which time the vine is ripening its fruit.

The fruit of the vine is used as an article of diet in several ways. Its agreeable sweet acid flavour when ripe has always rendered it a very desirable food when fresh. The ancients also, there can be little doubt, were in the habit of drinking the expressed juice of the grape before fermentation. Grapes are also dried and used under the name of raisins. The drying is generally effected by cutting half through the fruit-stalk whilst they are suspended on the tree. Grapes thus dried are called Muscatel raisins, and are principally brought from Spain and the Levant. There is another dried grape used much in England, called currants, or Corinths, but which are very different things from the common currant of our gardens, and are the produce of a vine which grows in Zante and Cephalonia. Dr. Wight gives Vitis adnata, 144; angustifolia, 176; auriculata, 145; carnosa, 171; lanceolaria, 28; lanceolaria, 177; muricata, 740; Neilgherrensis, 965; pallida, 50; quadrangularis, 51; setosa, 170.

(8604) VITIS CARNOSA, Wall. *Syn.* Cissus carnosa, R.

Kusar. HIND. | Kanapa tiga. TEL.

Remarkably acrid, roots used in native medicine; it is common in hedges and forests in Bengal, and it flowers in the rainy season.

The Cissus setosa is in all its parts excessively acrid, and Roxburgh states that the leaves toasted and oiled are applied to indolent tumors to bring them to suppuration. The young tender and succulent stems of Vitis (Cissus) quadrangularis are very generally eaten in India. When old this plant is deemed acrid, and a useful medicine; in arabia it is used as an external application in rheumatic pains of the back and loins. The Cissus arborea of Forskahl is the Salvadora persica of modern writers, and possesses some remarkable and valuable properties—see art. *Salvadora.—O'Shaughnessy, page* 245.

(8605) VITIS INDICA (Andhouka, DUK.) produces beautiful clusters of round purple berries and a large grape which is very fair eating; it is not the common vine of Europe, which nevertheless is probably this Himalayan plant, the *Vitis Indica*.

The origin of the common grape being unknown, it becomes a curious question to decide whether the Himalayan *Vitis Indica* is the wild state of that plant: a hypothesis strengthened by the fact of Bacchus &c., having come from the East.—*Hooker, Him. Jour. Vol.* II. *p.* 187. A wild shrubby climbing plant, common throughout the Deccan.—*Riddell.*

There are three or four species of grapes in the Tenasserim Provinces. This one is seen creeping over every hedge and bush, which has sometimes been mistaken by Europeans for the true grape vine, but the fruit is acrid, like all the indigenous species, and not edible even to a native.—*Mason.*

(8606) VITIS QUADRANGULARIS.

Perrunday, TAM.

This trailing, and creeping plant with 4 angled and winged stems is used by the Natives as greens, and in the preparation of chatney; cultivated about villages.—*Jaffrey.*

(8607) VITIS VINIFERA. Lin. THE WINE GRAPE.

Booangoor, MALAY.
Ungoor, PERSIAN and DUK.
Draksha, SANS.
Dakh. HIND.
Inub. ARAB.
Kodimoondrie pullum, also Dividatsi, TAM.
Dracha pundoo. TEL.

A native of the south of Asia Minor, now universally cultivated. The common Grape fruit is cultivated in the greatest perfection in all parts of the Deccan, and the finest flavored are found in the gardens in then eighbourhood of Dowlatabad, about seven miles N. W. of Aurungabad. The mode of culture is as follows:—the trees are reared from slips taken at the time of first cutting after the rains, and when ready to be removed are put about seven or eight feet apart. They are for the first twelve months trained on dry sticks; after that, a large straight branch of the pangrah, with a fork left at the top to support the vine, is placed about twelve inches from it; if put at a greater distance it is apt to give a bend to the vine which is hurtful. The vine cannot be too straight, and the length of the prop should be about five feet. —*Riddell.*

(8608) *Raisins, Uvæ passæ*, are Grapes in their dried state and well known, being prepared by being dried in the sun or in ovens, or by steeping them in a weak alkaline ley formed from the ashes of the burnt tendrils. Some are prepared by partially cutting the stalk of the bunches before the grapes are quite ripe, and allowing them to dry upon the vine. They are chiefly prepared in Spain and in the Levant, hence called Valentias and Smyrnas; also in Affghanistan, whence they are taken to India. The best are the Muscatels, from the grape of that name. The Sultanas, like the *Bedanas* of the East, are without stones. The Malaga Raisins are large and fleshy, of a purplish-brown colour. Those of Calabria are similar. The Smyr-

rna Raisins are of a yellowish-brown colour, slight musky odour, less sweet and agreeable than the former.

Raisins differ from Grapes in containing less water and acid, and more Sugar. The Lees of the Wine, yield Tartar, that is impure Cream of Tartar. As the Saccharine matter disappears and becomes converted into Alcohol, this salt, being insolnble in the Spirit formed, is deposited in the casks, and is well known by the name of *argol* or *tartar*. This is chiefly composed of Bitartrate of Potash with a little Bitartrate of Lime. Besides its own particular uses (*v.* p. 86), it is important as the salt from which Tartaric acid is obtained.

Must is the expressed juice of the ripe grape. It readily undergoes fermentation. Fermented Must gives two products, *wine* and *vinegar*.

Wine. Wine is a white, rosy or red liquid, according to the kind of grape used, and the process followed. It is fluid, limpid, and more or less alcoholic, &c. Sugar is present in some kinds. The smell and taste vary indefinitely. The wines chiefly employed in Hospital practice are two—port (Oporto) and sherry, (Xeres)

Port is red, approaching to crimson, slightly astringent. The extract consists of tannic and gallic acid, sugar and colouring matter. By distillation port wine of best quality yields of alcohol 23 per 1000.

Port is very much employed in disease of debility, scurvy, typhus fevers, cholera, the last stages of dysentery, consumption, &c.

Sherry (Vin de Xeres) is light amber coloured, sweetish, 100 parts contain 18 of alcohol. There is no astringent matter, but traces exist of citric and malicacid. Sherry is employed as a stimulant but is apt to produce an aperient and even cathartic effect. Various fraudulent substitutions are daily used in the preparation of wines, to detect which M. Fee gives the following rules, which have been found to be correct.

The alcoholic solution of caustic potash changes	
Pure wine, ...	*Green.*
If coloured with mulberries, ...	*Violet.*
——— with logwood, ...	*Violet Red.*
——— with Brazil wood or beet root...	*Red.*
Acetate of lead precipitates	
Pure wine....	*Green.*
Wine adulterated with elder berries, logwood, or myrtle berries,...	*Deep blue.*
—— with red sandal wood, beet root, or Brazil wood, ...	*Red.*
Alum precipitates,	
Wine coloured with litmus,....	*Clear violet.*
——————— logwood,.	*Deep violet.*
——————— Brazil wood,...	*Red.*

Lead sometimes exists in wine, and is detected by adding carbonate of soda; carbonate of lead is thrown down, which will be turned black by sulphuretted hydrogen gas. Alum, which is often present, is detected by the wine affording a precipitate with ammonia, carbonate of potash, and acetate of baryta.

The manufacture of wine is carried on, on a very simple plan. The ripe grapes are trodden by men or cattle in a vat, and the juice which is thus forced out is called *Must*. The *Marc* or solid parts being mixed with the Must again in wooden tanks, fermentation soon takes place, much heat is developed, and carbonic acid gas is copiously disengaged; the Marc now rises to the surface of the tank, and when the effervescence ceases, the subjacent wine is drawn off from below, and the Marc subjected to strong pressure.

If the wine be bottled before the fermentation has terminated, it has the property of foaming in the glass in consequence of the sudden liberation of carbonic acid; champagne is thus manufactured. In the preparation of white wines the Marc is removed before fermentation.

According to Humboldt, the conditions of climate essential for the manufacture of good wine are, a range of temperature from 62 to 50° or even 47°, provided the winter heat is not lower than 38°, nor that of summer below 66° or rather 68°. At a higher mean temperature the juice passes too rapidly into the acid fermentation. The manufacture of wine thus becomes impracticable in the plains of India; moreover the rains set in so soon after the ripening of the grape, that the manufacture of raisins by sun-dryiug is equally impossible. Mr. Royle informs us of the existence of luxuriant vineyards in Kunawur, bstween N. lat 31° and 32° (or nearly that of Madeira) at an elevation of 9000 to 10,000 feet, the grape being of delicious flavour, and the climate exactly suited for both the wine and raisin manufacture. Grapes are also abundant in Cashmere, Cabul, and Bokhara, and afford both raisins and wine. The most celebrated of eastern wines however is the *Shiraz* perpared in the districts of Khol-lar, near the village of Bend Emir. There are two varieties, red and white, the former containing 15½, the latter nearly 20 per 100 of alcohol.

The different kinds of raisins called *Monuka*, *Kishmish* and *Bedana*, are, Mr. Royle states, brought chiefly from Istaulik.—*O'Shaughnessy, pages* 251-254.

(8609) VIVERRIDÆ, a family of Carnivorous Animals, embracing the genus *Viverra* of Linnæus. This author thus defines his genus *Viverra*:—Dentes primores vi: intermediis brevioribus. Molares plus quam tres. Lingua retrorsum, sæpe aculeata. Ungues exserti.

The species comprised under this genus, in the twelfth edition of the 'Systema Naturæ,' are *Viverra Ichneumon*, *V. nasua*, *V. narica*, *V. putorius*, *V. Zibetha*, and *V. Genetta*.

The *Viverrina*, Dr. J. E. Gray's third family of *Felidæ*, is the first of his second subdivision of that family, named, *Necrophaga*.

The *Viverrina* comprise the following genera; —*Viverra*, *Proteles*, *Prionodon*, *Genetta*, *Galidia*, *Galictis*, *Herpestes*, *Mungos*, *Atilax*, *Ichneu-*

VIVERRIDÆ.

mia, *Uva*, *Crossarchus*, *Ryzœna*, *Hemigale*, *Paradoxurus*, *Paguma*, *Arctictis*, *Cynogale*, *Cryptoprocta*, and *Bassaris*.

(8610) *Viverra* (Cuv.).—The deep pouch situated between the anus and the sexual organs, is divided into two bags filled with an abundant concretion of the consistence of pomade, exhaling a strong musky odour, secreted by glands which surround the pouch. Pupil of the eye round during the day. Claws only half retractile. Dental Formula:—

$$\text{Incisors}\frac{6}{6}, \text{Canines}\frac{1-1}{1-1}; \text{Molars}\frac{6-6}{4-4} = 36.$$

(8611) *Viverra Civetta*. The Civet. Length of the elongated body from two to three feet; tail about half as long as the body. Height from ten inches to a foot. Hair of the body long, brownish-gray, with numerous interrupted transverse black bands or spots of the same colour. The hairs on the ridge or middle line of the black from between the shoulders are longer; and can be raised or depressed at the pleasure of the animal. Legs and most part of tail black; upper lip and sides of the neck almost white. Eyes surrounded each by a black patch. Two or three black bands pass from the base of the ears obliquely towards the shoulder and neck, which last has a broad black patch. It is a native of the north of Africa. The Civet approaches in its habits nearest to the Foxes and smaller Cats, preferring to make its predatory excursions against birds and smaller quadrupeds in the night, although, like these *Carnivora*, it will occasionally attack its prey in the day time. In a state of captivity it becomes in a degree tame, but never familiar, and is dangerous to handle. The young are fed on farinaceous food, millet-pap for instance, with a little flesh or fish: and, when old, on raw flesh. Many of them are kept in North Africa to obtain the perfume which bears the name of the animal, and brings a high price. The civet is procured by scraping the inside of the pouch with an iron spatula at intervals about twice a week. If the animal is in good condition and a male, especially if he has been irritated, a dram or thereabouts is obtained each time. The quantity collected from the female does not equal that secreted by the male. Civet, like most other articles of this nature, is much adulterated, and it is rare to get it quite pure. The adulteration is effected with suet or oil to make it heavier.

(8612) *Genetta*, Cuv.

(8613) *Viverra Rasse* is a species found in Java. Dr. Horsfield says "it supplies in Java the place which the *V. Civetta* holds in Africa, and the *V. Zibetha* on the Asiatic continent from Arabia to Malabar, and in the large islands of the Indian Archipelago. I have endeavoured to show that, by its form and marks, it is essentially distinct from the *V. Zibetha*; and it differs as much in its natural disposition as in external characters. The *V. Zibetha* is an animal comparatively of a mild disposition; it is often found among the Arabs and Malaya who inhabit the maritime parts of Borneo, Macassar, and other islands, in a state of partial domestication; and by the account of the natives, becomes reconciled to its confinement, and in habits and degree of tameness resembles the common domestic cat. The Rasse, on the contrary, preserves in confinement the natural ferocity of its disposition undiminished. As the perfume is greatly valued by the natives, it is frequently kept in cages; but as far as I have observed, must always be obtained for this purpose from a wild state, never propagating in a state of confinement. "The Rasse is not unfrequently found in Java, in forests of a moderate elevation above the level of the ocean. Here it preys on small birds and animals of every description. It possesses the sanguinary appetite of animals of this family in a high degree, and the structure of its teeth corresponds strictly with the habits and modes of life. In confinement it will devour a mixed diet, and is fed on eggs, fish, flesh and rice. Salt is reported by the natives to be a poison to it. The odoriferous substance is collected periodically: the animal is placed in a narrow cage, in which the head and anterior extremities are confined; the posterior parts are then easily secured, while the civet is removed by a simple spatula." The substance obtained from the Rasse agrees with the civet afforded by the *V. Civetta* and *V. Zibetha* in colour, consistence, and odour. It is a very favourite perfume among the Javanese, and applied both to their dresses and, by means of various unguents and mixtures of flowers, to their persons. Even the apartments and the furniture of the natives of rank are generally scented with it to such a degree as to be offensive to Europeans; and at their feasts and public processions the air is widely filled with this odour. ('Zoological Researches.')

(8614) *Paradoxurus* (F. Cuv).—Has the character generally of the Civets and genets.

(8615) *Paradoxurus Typus*, the Paradoxure.

(8616) *Mangusta*, Olivier. [Ichneumon.]

(8617) *Mangusta Javanica*, has the ear bearing considerable resemblance to that of man. Pouch very extensive. Hair long on the body and tail, but short on the head and extremities, rigid and glossy. Length, including the tail, about 2½ feet. Rumphius gives a curious account of this species, which is the Garangan of the natives, who greatly admire its agility. It attacks and kills serpents with the greatest boldness; and Rumphius speaks of its value in performing this service and its method of encountering those reptiles. The Javanese nobles, he says, pay a considerable price for it, that they may amuse themselves with the sport of these fights, when

the two enemies are opposed to each other, the serpent endeavours to twine round the quadruped and kill it. The latter submits to this, but inflates itself to turgescence; and when the serpent enfolds it and advances its head to give the deadly bite, the Mangouste contracts his body, slips out of the folds, seizes the serpent by the neck and kills it. Dr. Horsfield states that the *Mangusta Javanica* is found most abundant in the large teak-forests and that it is very expert in burrowing in the ground in pursuit of rats. "It possesses," says our author in continuation, "great natural sagacity; and from the peculiarities of its character, it willingly seeks the protection of man. It is readily tamed, and in a domestic state it is docile and attached to its master, whom it follows like a dog; it is fond of caresses. and frequently places itself erect on its hind legs, regarding everything that passes with great attention. It is of a very restless disposition, and always carries its food to the most retired place in which it is kept to consume it. It is very cleanly in its habits. It is exclusively carnivorous, and very distructive to poultry, employing great artifice in the surprising of chickens. For this reason it is rarely found in a domestic state among the natives, as one of their principal articles of food is the common fowl, and great quantities are reared in all the villages. The Javanese also, like the Mohammedans in general have a great partiality for cats, and they are unwilling in most cases to be deprived of their society for the purpose of introducing the Garangan. It has also been observed that its sanguinary character shows itself occasionally in a manner that renders it dangerous in a family as a domestic animal, and it indulges at intervals in fits of excessive violence."

(8618) *Ryzæna*, Ill.

(8619) *Nasua*, Storr.

(8620) *Cercoleptes caudivolvus*, the Potto, or Kinkajou, is referred by some writers to *Ursidæ*, but by others to the *Viverridæ*. It has the following dental formula:—

$$\text{Incisors, } \frac{6}{6}; \text{ Canines, } \frac{1-1}{1-1}; \text{ Molars, } \frac{5-5}{5-5} = 36.$$

Eng. Cyc.

(8621) VIVERRICULA MALACCENSIS. MALACCA CIVET.

SYN. Viverra malaccensis, Gmelin.
" Rasse, Horsfield.
" Gunda, Buchanan Hamilton MSS.
" indica, Geoffroy.
" bengalensis, Gray: Illustr.
" pallida, Gray: Illustr.
Genetta manillensis, Eydoux.

The Indian civet-cats secrete an odoriferous substance identical with civet, though not the civet of commerce. This species is not infrequently found in the Tenasserim villages, and its secretion enters into the Burmese Materia Medica.—*Mason*.

Viverricula Malaccensis (V. indica Sykes) is a little civet like beast, with a sharp nose. It is the Gandogokul of the Bengalis.—*Blyth*.

(8622) VIVERRA ZIBETHA. ZIBETHCIVET.

SYN. Viverra Zibetha, Linne.
" undulata, Gray.
" melanurum, Hodgson.
" orientalis, "
" civettoides. "

This is another species of civet-cat, not so abundant as the preceding, which the Burmese call "the horse-cat," from the mane on its neck.—*Mason*.

(8623) VOLKAMERIA FRAGANS. VERBENACEÆ.

Irun, HIND.

A large common shrub with ovate cordate dentate leaves; white fragrant flowers (in the cold weather) terminal panicles.—*Riddell*.

(8624) VOLKAMERIA INERMIS.

Shangam coopy, TAM. | Kundali, SANS.
Sangkoopee, HIND. | Bunjoma, BENG.
Nalla Opie, TEL.

A scandent ramous shrub, pure white flowers, blossom nearly throughout the year, hedges are made with it.—*Riddell*. The juice of the root and leaves is bitter, and given as an alternative in venereal, and scrofula. Dose a table spoonful, The plant is common in the jungles, and is very beautiful. Nine species are described by Roxburgh, but he gives no account of their supposed medicinal virtues.—*O'Shaughnessy, page* 486.

(8625) VOLUTIDÆ, a family of Gasteropodous *Mollusca*, whose shells are prized by collectors above most others for their beauty and rarity; and which, from their numbers and carnivorous habits, are powerful agents in keeping the *Mollusca* and *Conchifera* within due limits—*Eng. Cyc.*

(8626) VOLUTA ÆTHIOPICUS (Broderip) *Æthiopicus* has the shell obovate, ventricose, of an orange-cinnamon colour. the spire coronetted with thick-set shore, vaulted spines; pillar 4-plaited This shell is native of the African Ocean and the East Indian seas.

(8627) VOLUTA VESPERTILIO, has the shell turbinated, armed with strong distant acute tubercles, white, yellowish, or reddish, painted with angularly flexuous spots; spire muricated, the apex with small tubercles; lip with a sinus above; pillar 4-plaited. It is found in the Indian Seas, Amboyna, Moluccas, &c. The species of *Voluta* have been found at depths ranging from 7 to 14 fathoms. The species are very numerous and very beautiful.

(8628) *Mitra*, Mitre Shells, have the shell fusiform, thick; spire elevated, acute; aperture small, notched in front; columella obliquely plaited; operculum very small. The animal has a very long proboscis; it emits a purple liquid, having a nauseous odour, when irritated. The eyes are placed on the tentacles, or at their base. Three hundred and fifty recent species and ninety fossil have been described.

(8629) *Mitra episcopalis*, Bishop's Mitre Shell. The animal has a narrow foot, compressed and channelled, at its root, nearly square and slightly auriculated in front with a marginal furrow, and pointed behind. The head is very small, rounded, with two tentacles, which are scarcely a line and a half in length; the eyes sessile at their base. An enormous proboscis, which is sometimes double the length of the shell. The respiratory siphon does not project beyond the canal; it is marked with black at the point: the rest of the animal is yellowish, The proboscis is white.

Shell turreted, smooth, white, spotted with bright red; pillar four-plaited; outer lip denticulated at its lower part; epidermis thin. It is found in East Indian seas and islands of the South Sea, Tongataboo.

(8630) *M. adusta*, has the shell fusiform, turreted, albido-lutescent, ornamented with longitudinal rufous-brown spots; the striæ transverse, impressed, rather remote, and dotted; the sutures crenulate; the pillar five-plaited. It is found at Timor, Vanikoro. There are at least two varieties,

(8631) *M. corrugata*. The shell is ovate-fusiform, longitudinally plicated, transversely rugous, whitish; bands and belts brown; whorls angulated above; the last whorls with a submuricated angle; pillar four-plaited. It is found in the Indian Ocean and New Guinea.

(8632) *Imbricaria* and *Cylindra* are subgenera of *Mitra*.

(8633) *Volvaria* has the shell cylindrical, convolute; spire minute; operture long and narrow; columella with 3 oblique plaits in front. The species, five in number, are all fossil.

(8634) *Marginella* has the shell smooth, bright; spire short or concealed; aperture truncated in front; columella plaited; outer lip (of adult) with a thickened margin. Animal similar to *Cypræa*.

(8635) *Oliva*, which is sometimes referred to *Buccinidæ*, has the following characters:—Animal involved, compressed, with a small head terminated by a proboscis; tentacles approximated, enlarged at their base and subulate at their extremity, carrying the eyes on small convexities about their middle part externally; foot very large, oblong, and slit transversely anteriorly; mantle with a single lateral lobe covering the shell in great part, with two tongue-like processes at the side of the branchial opening, and forming in front a very elongated siphon; a single branchial pectination; male organ very voluminous, on the anterior part of the right side. Operculum horny, elongated, very small with a marginal spex.

(8636) *Oliva textilina* has the shell cinereous white, subreticulated with flexuous dotted lines, with two brown bands inscribed as it were with characters; the callus of the canal prominent It is found in the Antilles and New Guinea.

(8637) *Oliva mausa* has the shell cylindrical, the apex retuse, black; lip subplicate externally: aperture white. It is found in the East Indian Ocean, Australia, and Amboyna.

(8638) *Oliva sanguinolenta*, has the shell cylindrical, very delicately reticulated, with rufous brown small lines, girt with two brown zones; the pillar orange-red. It is found in the East Indian Ocean and on the coast of Timor.

The species have been found at depths varying from the surface to twelve fathoms, on mud, sandy-mud, coarse sand, &c. The species are fond of flesh, but they only suck the juices; and at Mauritius they are taken with that bait in the following manner, according to Lieutenant Harford, who was for some time there, brought home some very fine Mauritian shells, and gave the information to Mr. Broderip. The fishery was carried on by means of a line made to run parallel with the bottom of the sea, to which line small nooses, each containing a piece of the arms of a cuttle-fish (*Sepia*), were appended so that the bait touched the bottom. To one end of the line a shot was attached by way of mooring; and over it were a buoy and a flag. The other end of the line swung with the tide, and that end was also marked by a buoy and a small flag. The sport was carried on in deep water over sand-banks, and the best times were the morning and the evening. The apparatus was occasionally cautiously drawn up and the Olives which were found adhering to the bait were taken into the boat in which the fishermen were.

Olivella, and *Scaphula*, Sowerby, and *Agaroma*, Gray, are sub-genera; 117 fossil and 20 recent species have been described. (Woodward, 'Manual of the Mollusca.')

(8639) VULOCAL, or Vulvaylum Maram, the Tamil name of a strong Ceylon wood which is used by the natives in making farming utensils. It grows to twenty inches in diameter, and twelve feet in height. The bark of this tree, with the Marandum bark and ginger, is used by the natives for cleaning and preserving the teeth.—*Edye, Ceylon.*

(8640) VULPES, Brisson, the generic name for a species of that sub-division of the great genus *Canis*, which has the pupils of the eyes elliptical or almost linear by day, though they become round or nearly so in the hours of darkness.

(8641) VULPES BENGALENSIS (Shaw) is brown above, with a longitudinal black band The space round the eyes is white, and the tail is terminated with black. It is the Fox of the Dukhun (Deccan), Kokree of the Mahrattas, *Canis Kokree* of Sykes, which the Colonel considers to be new to science, although it much resembles the descriptions of the Corsac, and is

described by him ('Zool. Proc.,' 1831) as a very pretty animal, but much smaller than the European Fox.

(8642) VULPES VULGARIS (Brisson), the Common Fox; *Canis vulpes*, and *C. alopex* (the latter the variety it may be called, with the tip of the tail black?) of Linnæus; Volpe of the Italians; Raposa of the Snapish; Rapoza of the Portuguese; Fuches of the Germans; Vos of the Dutch; Raff of the Swedes; Rev of the Danes; Tod of the Scotch; Llwynog, fœm. Llwynogs of the Welsh, is too well known to require description. The time of gestation may be taken at from 60 to 65 days, and the birth of the young takes place in April. In a year and a half they attain their full size, and have been known to live 13 or 14 years; but as this can only have been ascertained, observes Mr. Bell, of individuals in confinement, it is very probable that, in a state of nature, it considerably exceeds that period. Of its cunning much has been said, and a great deal of it is true. The reader will find some interesting remarks on the habits and economy of the Common Fox by Dr. Weissenborn in the number of 'Loudon's Magazine' (R. S.) for October 1837. The Common Fox inhabits, according to Linnæus, Europe, Asia, and Africa. Cuvier mentions it as reaching from Sweden to Egypt, both inclusive. Mr. Strickland notes it as occuring near Smyrna. The Fox named Melanogaster by Prince Bonaparte in his 'Fauna Italica' is probably a variety only The strong smell proceeding from the anal glands and urine of the Common Fox is very offensive.

(8643) *Canis Himalaicus*, The Hill Fox of the Europeans in the Doon, in Kumaon, and the more western and elevated parts of the mountains, agrees with the common European and American foxes (*C. vulpes* and *C. fulvus*) in the black marks on the backs of the ears, and in front of the hind and fore legs. The coat consists of long, close, rich fur, as fine as that of any of the American varieties, and of infinitely more brilliant and varied colours, (Royle, 'Flora Himalaica.') The following species of *Vulpes* are given in the 'List of the Specimens of Mammalia in the British Museum:'—*V. vulgaris*, the Fox; *V. flavescens*, the Persian Fox; *V. Azaree*, the Agouarachay; *V. Niloticus*, the Sabora; *V. Lagopus*, the Arctic Fox, or Peszi; *V. cinereo-argentatus*, the Kit-Fox; *V. fulvus*, the American Fox, or Makkeeshew; *V. Bengalensis*, the Kokree; *Magellanicus*, the Culpeo; *V. Corsac*, the Corsac; *V. Caama*, the Asse; *V. dorsalis*, the Senegal Fox; and *V. Zaarensis*, the Fennec. —*Eng. Cyc.*

(8644) VULTURIDÆ, a family of Raptorial Birds, whose geographical distribution is confined to warm climates, where they act as scavengers to purify the earth from the putrid carcasses with which it would otherwise be encumbered. It has been matter of dispute whether they are directed to their fetid food, for they seldom prey on living animals, by the eye or by the nasal organ. There can however, in our opinion, be little doubt that both the senses are made to contribute to the discovery of the carcass. The lofty flight and telescopic eye are well adapted to detect any dying or dead animal, and as the action of one vulture may be, in all probability is, watched by another, a sort of telegraphic communication as to the position of the object is kept up. [BIRDS; CONDOR.]

The *Vulturidæ* of Mr. G. R Gray from the first family of his first sub-order (*Accipitres Diurni*) of his first order (*Accipitres*). The following sub-families and genera are placed by Mr. Gray under thie family:—

Sub-family 1. *Gypaetinæ*.

Genus:—*Gypaetos*.

Sub-Family 2. *Cathartinæ*.

Genera:—*Neopliron*, *Cathartes*, and *Sarcoramphus*.

Sub-Family 3, *Vulturinæ*.

Genera:—*Gyps* (Sav.); *Vultur*; and *Otogyps* (G. R. Gray).

Sub-Family 4. *Racaminæ*.

Genus:—*Gyphoieraæ*, Rupp.; *Racama*, J E. Gray—*Vultur* (*Gyphoieraæ*) *angolensis*. We now proceed to give a few illustrative species:—

(8645) VULTUR AURICULARIS. The great African *V. Auricularis* has been observed in Greece, and has once been killed in France (in Provence): this resembles *V. Ponticerianus*, the so called 'King Vulture' common over the plaines of India, but is much larger, equalling *V. Monachus* in size: while the latter has also an analogous diminutive in Africa, in the *V. Occipitalis*.

(8646) VULTUR CINEREUS appears to be the Vautour Arrian and Vautour Noir of the French; Cinereous or Ash-Vulture and Bengal Vulture of Latham; and Grauer Gier of the Germans. It is a native of Europe. It is found in lofty mountains, and the vast forests of Hungary, the Tyrol, and the Pyrenees; the south of Spain and Italy; accidentally in Dalmatia; more frequently in Sardinia; in Sicily; rarely in Italy, and never in the forests; very accidently in Germany. Its food consists of dead animals and carrion, but never of living animals, of which it shows fear; the least animal, says Temminck, terrifies it. This is the genus *Gyps* of Savigny. Mr. Gould, in his great work on the 'Birds of Europe,' notices a deviation in this species from the true or more typical vultures, manifested in the partially bare neck, open ears, curved claws, and powerful beak.

(8647) VULTUR INDICUS, the Indian Vulture, has the head and neck denud-

ed of feathers; all the upper plumage Isabella-ash colour varied with brown and whitish; lower parts spotless very bright yellow; a slight short deep brown down, close set and very smooth, covers the breast; bill black, but the point lighter; naked skin of the head rusty ash. It is about the size of a turkey Total length 3 feet 3 inches. It is found in India and Ceylon. It is very voracious. It lingers all day near the sea-shore to prey on the dead fish thrown up by the waves. The species lives generally on carrion, and is said to disinter corpses. The flight of these vultures is heavy, and, like their congeners, they sometimes assemble in vast numbers on the battle-field.

(8648) VULTUR KOLBII, Kolbe's Vulture. This is the Stront-Jager of Kolbe, and the Chasse-Fiente of Temminck. The head is covered with downy ferruginous feathers, which are whitish on the back of the neck; a ruff of loose ferruginous or dirty white feathers round the back of the neck; cere blackish; iris black; back and wings ferruginous or gray-brown; quills black; belly rather lighter ferruginous; feet brownish; claws black. Size less than that of the Griffon Vulture, but in general aspect and plumage very like that species. It is however easily distinguished. In Kolbe's Vulture the feathers of the wings and of the lower parts are all rounded at the end. In the Griffon Vulture they are long and acuminated. In Kolbe's Vulture the ruff is neither so long nor so abundant as in the Griffon, and the adult is nearly entirely of a whitish-Isabella colour. The adult Griffon is uniform bright brown throughout. It is found in Barbary, and different parts of Africa, India, and Java.

(8649) *Gypaetus barbatus*—This is the celebrated Lammergeier. It is the Avoltoio Barbuto of the Italians; the Weisskopfige Geier Adler, and Bartadler of the Germans; and Bearded Vulture of the English. Head and upper part of the neck dirty white; a black stripe extends from the base of the beak, and passes above the eyes; another, arising behind the eyes, passes over the ears; lower part of the neck, breast, and belly, orange red; mantle, back, and wing-coverts, deep gray-brown, but on the centre of each feather is a white longitudinal stripe; wings and tail feathers ashy-gray, the shafts white; tail long, very much graduated; beak and claws black; feet blue; iris orange; eye surrounded by a red lid. Length about four feet seven inches. According to the age of the bird the plumage varies as follows:—there are brown feathers more or less on the top of the head; those of the lower part of the neck, breast, and belly often terminated with black; the whole white on the middle of the feathers of the back and the coverts of the wings more or less developed; the belly often of a gray brown or variegated with white; iris of a more or less deep orange colour. The young in the first two years have the head and neck of a brown-black; the lower part of the body gray-brown with spots of dirty white; on the upper part of the back are great white spots; the mantle and the wing coverts are blackish with brighter spots; quills blackish-brown; iris brown; feet livid. It inhabits the highest mountains of Europe, Asia, and Africa, the chain of the Pyrenees, and the Helvetian, Alps, Sardinia, Greece, and the Tyrol. In Asia, the chain of the Caucasus, the Himalaya Mountains, the Siberian and Persian Mountains. It is also found in the lofty mountains of Central Africa and towards the borders of the Red Sea, principally in the most inaccessible parts of those mountains, and where there is plenty of the larger sort of game. "Unlike the typical vultures," says Mr. Gould, "which are distinguished by their bare necks, indicative of their propensity for feeding on carrion, the Lammergeyer has the neck thickly covered with feahers, resembling those of the true eagles, with which it also accords in its bold and predatory habits, pouncing with violent impetuosity on animals exceeding itself in size; hence the young Chamois, the Wild Goat, the Mountain Hare, and various species of birds find in it a formidable and ferocious enemy. Having seized its prey, the Lammergeyer devours it upon the spot, the straight form of their talons disabling them from carrying it to a distance. It refuses flesh in a state of putrefaction, unless sharply pressed by hunger; hence nature has limited this species as to numbers: while, on the other hand, to the Vultures, who are destined to clear the earth from animal matter in a state of decomposition, and thus render the utmost service to man in the countries where they abound, she has given an almost illimitable increase."

(8650) *Neophron percnopterus*. This is the Vautour Ourigourap of Le Vaillant, the Rhachamah or Pharaoh's Hen of Bruce and others, Avoltoio Aquilino and Caporaoccajo of the Italians, and Maltese Vulture of Latham. Head and only the front of the neck covered with a naked skin of a livid yellowish colour; the whole plumage pure white, except the great quill-feathers, which are black; feathers of the occiput long and loose; cere orange, iris yellow, mandibles blackish; feet livid yellow, claws black, tail very much graduated. Length two feet and a few inches. According to age, the bird varies in its plumage, being either deep brown spotted with rusty, or bright gray-brown varied with white and yellow feathers. In this state the naked part of the head is livid, the cere white slightly tinged with orange, the iris brown, and the feet livid white. The young in the first year have the naked part of the head livid, covered with a thin gray down; cere and feet gray ash; the whole plumage deep brown varied with yellowish-brown spots; greater quill-feathers black; iris brown.

It is found (very rarely) in the north of Europe, in Switzerland in the neighbourhood of Geneva. Very common in Spain on the Pyrenees, Portugal, Malta, Turkey, and in the Archipelago. No where so abundant as in Africa. Russia as far north as Astracan, Arabia, Persia; the Deccan (Col. Sykes).

(8651) VULTUR LENCONOTUS, the Chinese Vulture. This bird is brownish-black; lower part of the back white, as are the wings beneath and the inside of the thighs; when the wings are closed the white on the back is not seen; head brownish-black with short dark hairs; back of the neck covered with whitish down, the front of it livid flesh-colour and bare; at the bottom of the back of the neck is a dirty white ruff; on each side white feathers lap over the bottom of the neck and the crop; the cere is blackish; the bill horn-colour, black at the tip; iris dark; legs dirty brown-white with black scales; claws black. It is the size of a turkey.

(8652) VULTUR PONTICERIANUS, the Pondicherry Vulture. The adult is about the size of a goose; a long loose naked membrane or wattle takes its origin about an inch below the meatus auditorius, and widens into a rounded form in the middle; the whole head and neck naked and flesh-colour, but there are some short scattered hairs thereon; crop covered with a small brown down, and round it is a longer white down The young with the head and neck more or less clothed with short down. (Temm.) It is a native of Bengal (probably spread over the continent of India), Java, and Sumatra.

(8653) *Vultur Fulvus*, the Griffon Vulture, is Le Griffon of the French; Weisskopfiger Geier of the Germans; Avoltoio di Color Castagno of the Italians. Head and neck covered with close-set, short, white, downy feathers; lower part of the neck surrounded with a ruff of long, slender, white feathers, sometimes with a slight tinge. On the middle of the breast a space furnished with white down. The whole of the body, the wings, and the origin of the tail yellow-brown or Isabella colour; quills and tail-feathers blackish-brown; beak livid-yellow, cere darker [Temminck describes it as flesh coloured;] iris hazel; feet gray or light-brown. Total length exceeding four feet. The female is larger than the male. The young have a whitish down varied with brown on the head and neck; the rest of the body very bright yellow, marked with great spots of gray or white. It is a native of the mountainous parts of the north of Europe, Silesia, the Tyrol, Dalmatia (where it is very numerous), Spain (abundant near Gibraltar), the Alps, the Pyrenees, Turkey, the Grecian Archipelago, the north of Persia, and the north of Africa. The nest of this Vulture is generally formed upon the most elevated and inaccessible rocks but it often builds on the highest forest-trees, and in Sardinia on the loftiest oaks, where the nest of brushwood and roots is more than three feet in diameter. The eggs, which are generally two in number, though some state that it occasionally lays as many as four, are of a dull-greenish or grayish-white, slightly marked with pale reddish spots, and with a rough surface. Like all the other *Vulturidæ*, it feeds principally upon dead carcasses, to which it is frequently attracted in very considerable numbers. "When it has once made a lodgment upon its prey, it rarely quits the banquet while a morsel of flesh remains, so that itis not uncommon to see it perched upon a putrefying corpse for several successive days. It never attempts to carry off a portion even to satisfy its young, but feeds them by disgorging the half-digested morsel from its maw. Sometimes, but very rarely, it makes its prey of living victims, and even then of such only as are incapable of offering the smallest resistance; for in a contest for superiority it has not that advantage which is possessed by the Falcon tribes, of lacerating its enemy with its talons, and must therefore rely upon its beak alone. It is only however when no other mode of satiating its appetite presents itself, that it has recourse to the destruction of other animals for its subsistence. After feeding, it is seen fixed for hours in one unvaried posture, patiently waiting until the work of digestion is completed, and the stimulus of hunger is renewed, to enable and to urge it to mount again into the upper regions of the air, and fly about in quest of its necessary food. If violently disturbed after a full meal, it is incapable of flight until it has disgorged the contents of its stomach; lightened of which, and freed from their debilitating effects, it is immediately in a condition to soar to such a pitch as, in spite of its magnitude, to become invisible to human sight. In captivity it seems to have no other desire than that of obtaining its regular supply of food. So long as that is afforded it, it manifests a perfect indifference to the circumstances in which it is placed." (Bennett.)

(8654) VUNDOOROO WOOD.

Vundooroo kurra, TEL.

(8655) VUTTOMS. In Southern India pieces of cast steel, as they come from the crucible.

W.

(8656) WALAN, the name of a tree in Amboyna, which was first described and figured by Rumphius, in his 'Herbarium Amboinense,' and called by him *Ichthyoctonos montana*. It is a large tree, and much valued by the natives of the island in which it grows. It is very rare, and the description of Rumphius is too imperfect to allow at present of its being assigned to any particular division of the vegetable kingdom.

The inhabitants of the isle of Amboyna use the bark of the roots for catching fish. Before it is used for this purpose it is powdered, and the process by the natives is always attended with a peculiar ceremony. The bark of the root is the part of the tree employed, and when it is collected for fishing, a large party attends. It is powdered by a single individual with a large stone, and whilst this process is going on, the rest lie round the stone in a circle; when all is over, a signal is given by one of them crowing like a cock; they then arise and collect the powder into little baskets which is reserved for use. In catching the fish other ceremonies are employed The party goes in the morning early, and after throwing the powder upon the water and mixing it till it foams, they cast a net over the river, and then retire from the river, maintaining a death-like silence till the poison has acted on the fish In the course of an hour the net is generally found full of half-dead fish. The fish will recover from the effect of the poison if thrown into fresh-water, and are quite wholesome as food, although they will not keep so long as fish caught by other means. Rumphius procured some of the bark, and, omitting the ceremonies, found it a very successful mode of fishing.—*Eng. Cyc.*

(8657) WALKERA, a genus of Plants named after Richard Walker, D. D., founder of the botanic garden at Cambridge. It belongs to the natural order *Ochnaceæ*, and is known by possessing 5 petals, 5 stamens with ovate anthers; an obovately kidney-shaped fruit, which is a drupe; an inverted embryo with a hooked beak. There are two species of this genus known. *W. serrata* has serrate crenate leaves, racemes of flowers somewhat corymbose, and the lobes of the calyx lanceolate. It is a native of Malabar and Ceylon, and has yellowish flowers and reddish fruit The roots and leaves are very bitter, and are used in decoction by the inhabitants of Malabar as a tonic and anthelmintic. *W. integrifolia* is a native of French Guyana, and has entire leaves. —*Eng. Cyc.*

(8658) WALL FLOWER, CHEIRANTHUS.

(8659) WALLICHIA, a genus of Plants belonging to the natural order *Byttneriaceæ*, named in honor of the late Dr. Wallich, superintendant of the East India Company's Botanical Garden at Calcutta.—*Eng. Cyc.*

(8660) WALLICHIA OBLONGIFOLIA, the Ooh of the Lepchas, a palm which grows in Sikkim. It affords an admirable fodder for horses, who prefer it to any other green food to be had in those mountains.—*Hooker Vol.* I. *p.* 143.

(8661) WALNUTS.

Akroot Jowz, Khusif, ARAB.	Char-mughz, Geerdighan, Jouz-i-roomie, PERS.
Noix, FR.	
Akroot, GUZ, HIND.	Okher. NEP.

The fruit of a large tree (*Juglans regia*), indigenous to Persia, and the countries bordering on the Caspian Sea. It has long been introduced into Great Britain. The fruit is a pretty large, smooth, ovate nut, containing an oily kernel, divided into four lobes. They are made into pickle and ketsup; and the dried ones are served up, in a bruised state, at desserts. Persian walnuts are the most esteemed, and are the only sort met with in India.—*Faulkner.* See JUGLANS.

(8662) WALNUT INDIAN.-Vide ALEURITES TRILOBA.

(8663) WALNUTS, UKROT, grow on the Himalayas and Cashmere. Walnuts are occasionally brought from Rangoon; but it is not certain that they are the produce of the indigenous walnut *Juglans aryuta* tree of Tenasserim.—*Mason.*

(8664) WALSURA PISCIDIA.

Wallursi, TEL.	Joe-boe, BURM.
Walsura, TAMUL.	

A native of the Circar mountains; flowers during the cold season. Roxburgh informs us that the bark thrown into ponds intoxicates the fish, which are consequently very easily taken. The fish are not deemed unwholesome. —*O'Shaughnessy. Walsura piscidia* is very plentiful in the Pegu and Tounghoo Forests, as well as in the Tharawaddey Forests. The timber is large, heavy and strong. Wood, white colored, adapted to every purpose of house-building. —*McClelland.*

(8665) WALSURA ROBUSTA. Another species of Walsura, (Robusta) exists in Sylhet, but the bark is not employed as a fish poison. —*O'Shaughnessy, page* 247.

(8666) WANEDILE. A rather hard, fine, close even-grained, heavy Ceylon wood.

(8667) WATCHES.

Montres, FR.	Guryall, GUZ. HIND.
Uhren Taschenuhren, GER.	Sahut. PERS.
	Karmannue taschasn, RUS.

' Oriuoli da tasca, o da saccoccia, It. | Relojes de faltriquera, Sp.

Are pocket time pieces composed of wheels and pinions,—a regulator to direct the quickness or slowness of the wheels, and a spiral spring which communicates motion to the whole. *Waterston.—Faulkner.*

(8668) WATER CRESS. NASTURTIUM. The leaves, loot putha. The seeds, hurufs, Herb (recent) and seeds of Nasturtium officinale. The Water Cress is a native of Great Britain. Is generally raised from slips. It thrives best in running streams, and is to be had all the year round. It is grown from seed in beds near a water course, and the supply may be kept up for any length of time. A small black caterpillar is very destructive to it : the only remedy is flooding the plants for a short time.—*Jaffrey.*

(8669) WATER FOWL. An enormous quantity of water fowl breed in *Tibet* including many Indian species that migrate no further north. The natives collect their eggs for the markets at Jigatzi, Giantchi, and Lhassa, along the banks of the Yaru river, Ramchoo, and Yarbru and Dochen lakes. Amongst other birds the Sara, or great crane of India (see "Turner's Tibet," p. 212), repairs to these enormous elevations to breed. The fact of birds characteristic of the tropics dwelling for months in such climates is a very instructive one, and should be borne in mind in our speculations upon the climate supposed to be indicated by the imbedded bones of birds.—*Hooker, Him. Jour. Vol.* II. *page* 161.

About two days journey from *Delhi* is the Nujjufghur jheel, a great marsh covered with water fowl. The method of capturing them there, accords with the practice that obtains in other parts of India. Earthen vessels, wide enough to admit a man's head into them and perforated with small holes, are allowed to float about for days on the surface of this "Jheel," until the ducks, teals, and water-fowl in general, seeing them daily, become quite accustomed to the sight and fearlessly swim around and even approach and peck at them. This preparatory step, is followed by the fowler supplying himself with a wooden float, strong enough to support him. Using it like a hobby-horse under him, he launches himself into the swamp with an earthern vessel over his head, of a similar size and kind and similarly perforated as those indicated above. The float is dispensed with in many parts of the marsh that are shallow. The fowler likewise supplies himself with a bag of net work, which is tied round his waist, and thus equipped he silently paddles himself along with his hands under water, until he gets among the earthern vessels and fairly amid the birds. He commences his task by quietly and patiently pulling them down one by one by their legs, and putting them into the bag, which is so well adjusted round his person, that the struggles of the birds do not scare away the rest. Some use small baskets of wicker work with a lid of the same material which answer the purpose better. When the bag or basket is full, the fowler recedes to the spot whence he set out on his aquatic expedition and there empties the contents into a basket large enough to contain about four or five times the number of the small one and then begins anew. Large nets are also laid out on favorable sites, towards which the ducks &c., are driven and are thus taken in great numbers. Mr. French was not aware if the decoy-bird is known among the natives or if they adopt one as a means of entrapping others of its species. These helpless creatures are sold at from 25 to 30 for a Rupee which itself is an indication of their being very numerous and numerously caught.—*Tour of India by French, Page* 193.

In *China*, the fenny margins of lakes and rivers and the marshes on the sea-coasts, afford both food and shelter to innumerable flocks of water-fowl. The banks along the wide delta of the Pearl river and the islands in it, are frequented by immense flocks of geese teal, ducks and other birds; and they are likewise very abundant and tame along the inland water-courses. Ducks are sometimes caught by persons who first cover their heads with a gourd pierced with holes, and then made into the water, where the birds are feeding ; these previously accustomed to empty calabashes floating about on the water, allow the fowler to approach and are pulled under without difficulty. The wild goose caught on the shores of the Pearl river and the common goose of Chinese farm-yards do not differ much, both of them being a plain ashy grey color with a large knob at the base of the upper mandible, the domesticated species is almost too gross for the table from the ease with which it fattens. This bird and the mandarin ducks are both considered as emblems of conjugal fidelity and a pair of one or the other usually form part of wedding processions. The epithet mandarin is applied to this beautiful fowl, and also to a species of orange simply because of their excellence and beauty over other species of the same genus and not as some writers have inferred, because they are appropriated to officers of Government.—*Williams' Middle Kingdom, page* 263. The yuen-yang, as the Chinese call this duck is the native of the central provinces and is reared chiefly for its beauty. It is one of the most variegated birds known, vying with the humming birds and parrots in the diversified tents of its plumage. if it does not equal them for brilliancy.—*Williams' Middle Kingdom, page* 264.

(8670) WATER-LILY, the common name for the species of the family *Nymphæaceæ.* [NYMPHÆADEÆ.] One of the most beautiful and the largest of the tribe is the *Victoria Regia.* This splendid plant, in the dimensions of its leaves, their varied tints, the colour, size, and

fragrance of its flowers, may deservedly be called the queen of flowers. The following is the account of its discovery by Sir Robert Schomburgh: "It was on the 1st of January, while contending with the difficulties nature opposed in different forms to our progress up the river Berbice, that we arrived at a point where the river expanded and formed a currentless basin. Some object on the southern extremity of this basin attracted my attention; it was impossible to form any idea what it could be, and, animating the crew to increase the rate of their paddling, we were shortly afterwards opposite the object that had raised my curiosity—a vegetable wonder. All calamities were forgotten; I felt as a botanist, and felt myself rewarded;—a gigantic leaf, from five to six feet in diameter, salver-shaped, with a broad rim, of a light green above and a vivid crimson below, resting on the water. Quite in character with the wonderful leaf was the luxuriant flower, consisting of many hundred petals, passing in alternate tints from pure white to rose and pink. The smooth water was covered with the blossoms, and as I rowed from one to the other I always observed something new to admire." The leaves are very large, measuring five or six feet in diameter. They have an orbicular form, the upper surface is bright green, and they are furnished with a rim round the margin from 3 to 5 inches in height; on the inside the rim has a green colour, and on the outside, like the under surface of the leaf, it is of a bright crimson; they have prominent ribs, which project an inch high, radiating from a common centre; these are crossed by a membrane, giving the whole the appearance of a spider's web; the whole leaf is beset with prickles, and when young is convolute. The calyx is 4-leaved, each sepal is 7 inches in length and 4 inches broad; the corolla covers the calyx with hundreds of petals; when first opened it is of a white colour, but subsequently changes to pink; it is very fragrant. Like all other water-lilies, its petals and stamens pass into each other, a petal often being found surmounted with half an anther. The seeds are numerous, and imbedded in a spongy substance. This plant has by some botanists been placed in the genus *Euryale*, whilst Lindley thinks it is nearer *Nymphæa*, from which it differs in the sepals and petals being distinct, the papilla of the stigma being prolonged into a horn, and the changing colour of its petals. This splendid plant has now been successfully cultivated in many of the hot houses of England. Beautiful specimens are to be seen in the Royal Gardens at Kew, and at the Cyrstal Palace, Sydenham.—*Eng. Cyc.*

(8671) WATER LILY. Vide NELUMBIUM AND NYMPHÆA.

(8672) WATERS, MINERAL. Mineral waters derive their distinctive characters from the formations or strata through which they flow. Those of the primitive formations are almost all thermal, and generally possess a high temperature. Those of the older secondary formations are generally of a lower temperature. The newer, secondary, and the tertiary strata, give forth cool mineral waters. The chemical contents—sulphuretted hydrogen, free carbonic acid, carbonate of soda, other salts of soda and of lime, silica, sulphate of magnesia, oxide of iron, free sulphuric and muriatic acids—vary in almost every individual case; but there is a general tendency in mineral waters from the primary formations to a sort of similarity of chemical contents, and so likewise in respect to the secondary and tertiary formations. Leaving out *thermal* waters, which are not designated mineral waters unless for some additional quality besides their high temperature, mineral waters are often classed into *saline*, *alkaline*, *chalybeate*, and *sulphureous*. Most of the celebrated Spas belong to one or other of these four classes,—the Cheltenham, Leamington, Harrogate, Carlsbad, Marienbad, Kissingen, Wiesbaden, Seidlitz, and Baden Baden waters are saline-aperient, some hot and some cold; or, rather, it should be said that *some* of the springs at these places are saline-aperient; for there are other springs at the same towns possessing very different qualities. Alkaline waters are met with at Bath, Cheltenham, Leamington, Harrogate, Scarborough, Carlsbad, Marienbad, Kissingen, Toplitz, Wiesbaden, Vichy, and many other places. Among the places at which chalybeat waters, or water in which the iron is associated with much free carbonic-acid gas, are met with, are Tonbridge, Harrogate, Brighton, Peterhead, Aix-la-Chapelle, Spa, Pyrmont, Schwalbach, Marienbad, and Seltzer. Sulphureous waters are found at Moffat, Askern, Harrogate, Aix la Chapelle, and other places. It will be seen that Harrogate possesses a large variety of these mineralized waters. A small number of springs contain iodine, and are on that account useful in certain maladies. There are springs of this kind at Tewkesbury, Cheltenham, Gucester, Leamington, Builth, Llandrindod, and Kreuznach. Some others contain a little bromine, and a few contain both iodine and bromine.—*Tomlinson.* See HOT SPRINGS; MINERAL WATERS; SPRINGS and THERMAL SPRINGS.

(8673) WA-WEI. A vegetable poison used by the natives of the Somali Coast and others in the interior of Africa, for poisoning their arrows. It is an inspissated decoction of the root of a tree which is not determined, but is supposed by Dr. Cleghorn to be one of the Laganiaceæ or Apocynaceæ. It is used both in hunting and in war, and is said not to be poisonous if swallowed.—*Madras Museum, Captain L. Playfair.*

(8674) WAX, BEES WAX.

Wax, an organic product of considerable importance, is obtained from different sources, the chief of which is the bee-hive, where it is used by the bees in the formation of their cells. It has long been a matter of dispute among naturalists, whether the bee collects wax already formed in plants, or secretes it from sugar in the mechanism of its body. The latter view of the case, in accordance with the originial observations of Huber, is that which is now generally adopted. It appears that those working bees, to which the manufacture of wax is assigned, take a quantity of honey or sugar into their stomachs, suspend themselves in a festoon, by each insect attaching the claws of its fore-legs to those of the hind pair of the insect above it, and in this way, forming a number of festoons crossing one another in all directions, they appear like a dense curtain. They remain in this position for 24 hours, during which the secretion of wax takes place. The secretion is formed in certain membranous bags in the body of the bee; and, as the secretion goes on, the wax oozes through the membrane, and forms in thin plates on the outside. The process being complete, one of the insects detaches itself from the rest, proceeds to the top of the hive, and begins to build. It grasps one of the plates of wax by means of a pincer, formed at one of the joints of the leg, and draws it forward, when it is conveyed by one of the fore-claws to the mouth. The insect, with its mandibles and proboscis, reduces the plate to a riband of wax, softening it with a frothy kind of liquor, which makes it white and ductile. The other insects proceed in a similar manner, and with such celerity, that in a new hive, a comb 20 inches long by 7 or 8 inches broad, will be constructed in 24 hours, and in five or six days the hive will be half filled. The wax thus produced is more or less yellow in colour, and has an odour resembling that of honey. The beautiful geometrical form in which it is arranged in the honeycomb is well known. When the wax has served its purpose in the domestic economy of the hive, it is collected for manufacturing purposes, by first allowing the honey to drain off, or to be pressed out, and then boiling the combs in water, with frequent stirring, that the wax may not burn. In this way the combs are completely melted, and the liquid is then poured through hair-bags, which are pressed as long as any wax continues to pass through. The sediment remaining in the bags is also boiled over again, and more wax extracted from it. During the operation, the wax from each bag is received in a vessel of cold water placed beneath it, and answering the double purpose of cooling the wax, and preventing it from sticking. The wax is melted a second and a third time, and passed through bags of increasing fineness on each occasion. Lastly, it is melted once more without water, and poured into pans or moulds wider at the top than at the bottom, and wetted with cold water to prevent sticking. The conical shape of the cake thus produced is advantageous in two ways; it is more easily disengaged from the pan, and it has all its sediment or dross collected into a small space at the under surface, and there is consequently less waste in removing it. The moulds are kept in a warm room until the wax has solidified, otherwise the cakes are apt to crack across the middle. This method, though commonly employed, is tedious, consumes much firing, and wastes a considerable amount of wax; for these successive meltings and removal of dross cannot be effected without loss. Attempts have been made to expedite the process; and those of Mr. Bagster "The Management of Bees," by Samuel Bagster, jun. London, 1834, recommend themselves by their simplicity. This gentleman gives directions for obtaining a marketable wax from the combs by a single operation, without either straining or pressing, in the following manner. In an earthen vessel, much narrower at bottom than at top, is placed water and *aqua fortis*, in the proportion of 1 ounce of the latter to every quart of the former. When these are well blended, as many good wax-combs are put in as will reach, when melted, to within a finger's length of the top of the pan. The pan is then set on a clear fire, and stirred while the wax is melting, and until it has boiled long enough to liqueify the whole completely. It is then removed from the fire, and allowed to cool gradually. The wax then forms into a cake at the top, and the impurities are underneath: these arrange themselves in two layers, the lowest of which consists almost entirely of dross, but the next contains a certain amount of wax. When the cake of wax is turned out of the pan, both these drossy layers are removed, leaving the cake pure; but the upper drossy layer is boiled over again with more combs, and with any scrapings which it may have been necessary to make from the upper surface of the wax in order to leave it quite free from extraneous matters. Old combs that have wax in them, or other descriptions of refuse that have been pressed, but yet retain a considerable portion of wax, are pressed down in a close tub or vessel in a house for five weeks. This causes the impurities to ferment and rot, without affecting the wax, which may then be treated as above described, and will

yield a fine yellow wax, little inferior to that of the best combs. Where very great purity is required, the best empty virgin combs are put into the same kind of vessel employed in the preceding process, but with only a quarter of a pint of water, to keep the wax from burning. The pan is then set over a clear fire, and stirred until it boils. At this time a clear yellow froth begins to rise up, which froth is to be skimmed off into a pan placed close at hand. The fire must be so managed that this froth shall continue to rise without boiling over, and a succession of skimmings are thus obtained which form a very pure description of wax. When no more froth will rise, the residue is turned out into a vessel of cold water, and can be boiled up again with other combs. This method is only available with a fine comb. By the above processes, bees-wax is freed from impurities, but is not deprived of its natural yellow colour. For the greater number of uses to which the substance is appropriated, it is, however, necessary that the wax should be rendered perfectly white. This is effected by exposing it in thin ribands on a bleaching ground, where it is subjected to the action of light, air, and moisture, and loses both colour and odour. Similar substances, but obtained from the vegetable world, are of far less importance than the product of the bee, yet they are deserving of notice. Several species of myrtle (*Myrica*) yield the product called *Myrtle-wax*. This is especially obtained from *Myrica cerifera*, which flourishes in Louisiana, the berries of which are incrusted with wax. By boiling these in water, a quantity of hard brittle wax of a pale green colour is obtained, of the specific gravity 1·015, the fusing point being 110°. A somewhat similar wax is obtained from *Myrica cordifolia*, a shrub which grows at the Cape of Good Hope. The stems and leaves of palm-trees also secrete the substance called *Palm-wax*. Such is the hard brittle greenish yellow wax which we obtain from Rio de Janeiro. It is soluble in boiling alcohol and ether; it fuses at about 163°. A white and crystaline wax, resembling spermaceti, is obtained from a kind of sumach, *Rhus succedaneum*, and is known in commerce as *Chinese* or *Japan wax*. It is soluable in naphtha, but scarcely so in alcohol and in boiling ether. It forms a soluble soap when boiled in a solution of caustic potash. It fuses at about 180°. Another wax, having the same fusing point, is found upon a hard and ligneous variety of the sugar-cane, and is known as *sugar-cane wax* and *cerosine*. This is soluble in boiling alcohol, but sparingly so in boiling ether. By boiling the bark of the cork-tree, *Quercus suber*, in alcohol, and distilling off the alcohol, a quantity of yellow crystals are obtained which form *cork-tree wax*, which may be purified by repeated solution and crystallization. Nitric acid converts this substance into a peculiar acid, called *cerinic acid*. The demand for wax is great in Roman Catholic countries, where gigantic candles of this substance are required for the service of the several altars; but the great improvement in the manufacture of composite candles has reduced the demand for wax candles as an article of domestic use. For the manufacture of wax candles and tapers, see CANDLE. The amount of wax produced in England is very large, but a considerable quantity is likewise imported from abroad. In 1840, nearly 4,000 *cwts.* were imported from the western coast of Africa, nearly 2,000 *cwts.* from Tripoli, Tunis, &c., and more than 1,000 *cwts.* from the East India Company's territories. This was at a time when the very heavy duty of 10*s.* per *cwt.* was laid upon this article. In 1842, the duty was reduced to 1*s.* and 2*s.* the *cwt.* The adulteration of this substance was great during the existence of the heavy duties, and is still practised to a less extent. The adulterants of yellow wax are earth, pea-meal, resin, &c. Those of white wax are white oxide of lead, white tallow, and potato-starch. Oxide of lead may be detected by simply melting the wax in water, when the oxide falls to the bottom; tallow is discovered by the dull opaque white which it gives to the wax, and starch is detected by means of sulphuric acid, which carbonizes the starch without acting on the wax. —*Tomlinson. In India*, Wax is obtained from West Coast of Africa, Barbary, Malabar, Zanzibar, and in small quantities from the West Indies, United States, Germany, France, &c. —*Waterston.* In 1851, Vegetable wax was sent from Shanghae, in China; from St. Domingo, in the northern parts of which the plant is indigenous; and a remarkable specimen from Japan. This substance, from its high melting point and other physical characteristics, has of late attracted a good deal of attention; it is admirably suited as a material for the manufacture of candles.—*Simmonds.* The wax-insect tree of China, says Mr. Fortune, is no doubt a species of ash (fraxinus). It grows abundantly on the banks of ponds and canals in the province of Chekiang; and a small quantity of wax is also produced in this province. I was indebted to Dr. McCarter of Ningpo, for some beautiful specimens of the fresh insect upon the branches of this tree. This insect has been named *Coceus pela* by Mr. Westwood. When fully developed on the trees it has a most remarkable appearance; they seem as if covered with flakes of snow. The wax is an article of great value in Chinese commerce, and a small portion is exported.—*Fortune's Residence, p.* 146,

(8675) WAX CANDLES. Various descriptions of wax candles were formerly made in India.

(8676) WAX FLOWER. VIDE TABERNÆMONTANA.

market. The hard wheat is preferred by the natives of India to the soft. Wheat is grown largely in Burmah, but Mr. Mason had never seen it under culture in the Tenasserim Provinces, although Commissioner Durand made an attempt to introduce it. No doubt, on the Karen mountains the cultivator would reap an ample harvest.—*Simmonds. Mason.*

(8688) WHEAT-MIDGE (Cecidomyia Tritici), a fly and its caterpillar, infecting wheat.—*Hassell.*

(8689) WHITE COPPERAS, White Vitriol, Sulphate of Zinc. Sal Vitrioli.

Sulfate de zinc, Fr.	Zinci-sulphas, Lat.
Schwefelsaures, Zinkoyd, Ger.	Caburnic, Sans.
	Vulley-tootum, Tam.
Suffeid-Tootia, Guz. & Hind.	Tootum, Tel.

A salt formed by the union of sulphuric acid, with the oxide of zinc. It is found native in the mines of Goslar, and other places.—*Faulkner.*

(8690) WHITING FISH. Indian Whiting. Sciena. Lin.

Kullengan mutchie also Darya ka Shaikra, Duk.	Kellunga meen, Tam.

(8691) WHITE LEAD (Carbonate) of, Ceruse.

Asfeidaj, Arab.	Plumbi Carbonas, Lat.
Plom Carbonate, Fr.	Suffeidah, Kash, Pers.
Bleiweiss, Ger.	Istibedsh, Turk.
Cerussa, It.	Moothoo Vullay, Tam.
Suffeidah, Guz. Hind.	Seebaydoo, Tel.

Is usually made by suspending thin plates of lead over heated vinegar, the vapour of which corrodes the metal, and converts it into a heavy white powder. Mixed with oil it forms a common paint; it is also employed in medicine.—*Faulkner.*

(8692) WHITE PEPPER.

Piper-album, Lat. | Suffeid-Mirch, Guz. Hind.

The fruit of a slender climbing plant (*Piper nigrum*), gathered after it is fully ripe, and freed of its dark coat by maceration in water. It is smooth on the surface; and is milder than the black-pepper. The plant is extensively cultivated in Malabar, Sumatra, Siam, Malacca, &c. —*Faulkner*

(8693) WIGHTIA. At Tonglo, in Sikkim, at an elevation of several thousand feet, Dr. Hooker found great scandant trees twisting around the trunks of others, and strangling them: the latter gradually decay, leaving the sheath of climbers as one of the most remarkable vegetable phenomena of these mountains. These climbers belong to several orders, and may be roughly classified in two groups.—(1.) Those whose stem merely twine, and by constricting certain parts of their support, induce death.—(2.) Those which form a net-work round the trunk, by the coalescence of their lateral branches and aerial roots, &c.: these wholly envelope and often conceal the tree they enclose, whose branches appear rising far above those of its destroyer. To the first of these groups belong many natural orders, of which the most prominent are—*Leguminosæ*, ivies, hydrangea, vines, Pothos, &c. The inosculating ones are almost all figs and *Wightia:* the latter is the most remarkable, for its grasping roots.—*Hooker Him. Jour. Vol.* 1, *page* 163-164.

(8694) WILD ALMOND OIL. Terminalia Catappa. A specimen of oil said to be obtained from the fruit of this tree was exhibited in the "Madras Tariff." At the Madras Exhibition of 1851, a sample labelled "Almond oil" from Tanjore is the product of this species of Terminalia.—*M. E. J. R.*

(8695) WILLOW. Salix. A species of willow, is one of the most abundant forest trees of Tenasserim on the banks of inland streams; and as many of the willows are medicinal, it is very probable that this also possesses medicinal properties, but they are as yet unknown.—*Mason.* A species of willow, Roxburgh describes as "a native of banks of rivulets and moist places among the Circar mountains," but a species of willow on this Coast is met on every stream before the influences of the tide ceases to be felt.—*Mason.*

(8696) WILLUGHBEIA, a small East Indian genus of plants belonging to the natural order *Apocynaceæ*, named after Francis Willughby F. R. S.—*Eng. Cyc.*

(8697) WILLUGHBEIA EDULIS: Roxb. Fl. Ind. ii. p. 67.

Lutian, Hind.

Forests of Chittagong and Sylhet. A very large climber: every part of the plant on being wounded discharges an abundance of fluid caoutchouc. The fruit is pulpy, soft, and yellow, and esteemed by the natives,—*O' Shaughnessy, page* 448.

(8698) WILLUGHBEIA MARTABANICA, There is a species of Willughbeia in the forests that produces a fruit as large as an apple, which Europeans sometimes call "a kind of fig." It has an agreeable taste but abounds in a milky juice.—*Mason.* Its colour is yellow, and it is about the size of an orange.—*Eng. Cyc. page* 1256.

(8699) WINE.

Khumr, Arab.	Mei, Pers.
Vin, Fr.	Vinho, Port.
Wein, Ger.	Wino, Wino-grandnoe, Rus.
Ungoor-ka-Shrab, Hind.	Madira, Sans.
Vino, It.	Vino, Sp.
Vinum, Lat.	

The fermented juice of the grape. There are a great many varieties of wines; and this circumstance, combined with differences of soil, climate, mode of preparation, &c., occasions an extreme variety in the species of wine—the chief of which are Port, Sherry, Claret, Champaigne, Madeira, Hock, &c.—*Faulkner.*

(8700) WINTERACEÆ, a natural order of Exogenous Plants. This order is characterised by possessing hermaphrodite or unisexual flowers; from 2 to 6 sepals, which are sometimes not to be distinguished from the petals; the petals are from 2 to 30 in number, and, when more than 5, in several rows; the stamens are hypogynous, short, indefinite, and distinct, arranged in a single whorl, 1-celled; the embryo is very small and straight, and situated at the base of a fleshy albumen. The order consists of small trees or shrubs, with alternate, dotted, coriaceous, persistent leaves; convolute deciduous-stipules; and solitary, sweet-scented, brown or chocolate-coloured flowers.

This order has obtained its name, given it by Brown, from *Winteria*, the old name of the *Drimys Winteri*. This name was given in honour of William Winter, a captain in the royal navy, who sailed round the world with Sir Francis Drake. It contains four genera—*Illicium, Temus, Drimys, and Tasmannia.*

These genera constitute the section *Illicieæ* of the order *Magnoliaceæ* of De Candolle, and the section *Wintereæ* of Lindley in the same order. They differ from *Magnoliaceæ* in their dotted leaves, and also in their aromatic qualities. There are about ten species, of which two are found in Australia, two in the hotter parts of America, two in South and two in North America, one in China and Japan, and one in New Zealand.—*Eng. Cyc.*

(8701) WINTERS BARK. A spice resembling *Canella alba*, contained from the *Wintera aromatica*, and on account of its aromatic and stimulant properties, has been used as a substitute for cinnamon. It is now seldom employed. —*Faulkner.*

(8702) WISTARIA, a genus of Plants belonging to the natural order *Leguminosæ*, named after Caspar Wistar, professor of anatomy in the University of Pennsylvania. It has the following characters:—The leaves are unequally pinnate, and without stipules. The flowers are arranged in terminal racemes, and are of a blue lilac colour: when young they are accompanied by bracts which fall off as the flowers expand. The calyx is campanulate, somewhat bilabiate, the upper lid has two short teeth, the lower lip three teeth, which are subulate; the corolla is papilionaceous; the stamens diadelphous; a nectariferous tube girds the stipe of the ovary; the legume is coriaceous, 2-valved, 1-celled, and rather torulose. The species are deciduous twining shrubs, natives of North America and China. They grow vigorously in Great Britain, and form in flower the handsomest ornaments of our gardens.—*Eng. Cyc.*

(8703) WISTARIA CHINENSIS, Chinese Wistaria, has the wings of the corolla each furnished with one auricle; the ovary villose; the flowers large. This plant is a deciduous twiner, and a native of China, and was introduced into England in 1816. It flowers in Great Britain in May and June, and sometimes produces a second crop of flowers in August. This species was originally called *Glycine Chinensis*, a name which in some places it still retains.—*Eng. Cyc.* In China Mr. Fortune saw a specimen of *Wistaria chinensis* in a dwarfed state, growing in a pot. The tree was evidently aged, from the size of its stem. It was about six feet high, the branches came out from the stem in a regular and symmetrical manner, and it had all the appearance of a tree in miniature. Every one of these branches was then loaded with long racemes of pendulous lilac blossoms. These hung down from the horizontal branches, and gave the whole the appearance of a floral fountain. *Page* 334.

(8704) WOAD.

Weede, Dut.	Guadone, Guado, Glasso,
Pastel, Guede, Vouede, Fr.	It.
Waid, Ger.	Pastel, Glasto, Sp.

A plant (*Isatis tinctoria*), indigenous to most parts of Europe; from the roots and leaves of which, a blue dye is obtained. Woad is now entirely superseded by the use of Indigo.—*Faulkner.*

(8705) WOMEN'S CLOTHS, COTTON. In Southern India, this description of cloth is chiefly manufactured at the town of Arnee in the Collectorate of North Arcot; they are of various colours with borders; chiefly used by Brahmin women: they are of ordinary qualities and sold at from 2 to 12 Rupees each.

(8706) WOOD. See Timber. The most important application of wood, is in the building and repairing of houses and ships, and in the construction of machinery. For this purpose the large trees, which come under the denomination of *Timber*, are chiefly employed. The conservation of growing timber is an art of considerable importance and inattention to this duty has allowed nearly every forest in India to be denuded of its principal trees. —*Tomlinson.* The value of wood and timber in India, is not to be measured by the estimation in which they are held, in temperate climates. In India they are not only applied to those economic uses with which all are familiar, but they also furnish fuel to all classes, supplying the place of that valuable mineral, coal. Besides this, the influence of trees on climate is very considerable tending as they do, to prevent the too rapid withdrawal of moisture from the soil, a point of great importance in a country, where the heat of the sun is intense, and the supply of water is dependent only upon periodical falls of rain. The value of timber would be best shown by the vast extent, to which it is employed in the various purposes of life. It is impossible to ascertain the amount used in India, but the quantity of firewood alone imported by sea into Madras during 5 years is given below, that for 1849-50

being estimated by the Military Board to be equal to 12,000 tons.

Years.	Billets.	Value Rs.
1845-46	63,61,816	32,536
1846-47	42,77,013	22,746
1847-48	56,78,794	31,974
1848-49	104,75,590	58,026
1849-50	98,51,050	66,101

The above is exclusive of imports by Cochrane's Canal, and the trunk roads which the Military Board estimated at upwards of 85,000 tons per annum.

The trade Reports of the Madras Presidency show that the exports of the following 5 woods alone, amounted in value to 3,84,000 Rupees in 1854, viz :—

Sandalwood, cwt.	11,684	137,944
Redwood, ,,	47,431	59,570
Sappanwood ,,	5,248	15,350
Ebonywood, ,,		4,859
Teak, ,,		216,368

The imports of timber into Great Britain alone in 1850, amounted to ten millions of cubic feet. See TIMBER.

(8707) WOOD APPLE GUM. Obtained from the *Feronia elephantum* is very abundant, and forms the well known "East India Gum Arabic." Mr. Rohde mentions that from its ready solubility without residue it gives the best mucilage for making Black ink.—*M. E. J. R.*

(8708) WOOD ENGRAVING. The following woods can be prepared for engraving upon.

Guava Psidium Pyriferum, (the best.)

Palay. Mimusops hexandra. A good wood but liable to be attacked by insects.

Veppaley. Wrightia antidysenterica. A fine close grained wood not quite so hard as the guava, but improving with age

Jujube or bayr fruit tree. Zizyphus jujuba, rather soft.

Wood apple tree. Feronia elephantum, too coarse in the grain.

Satin wood. Swietenia chloroxylon. A close grained wood but apt to split.

(8709) WOOD OILS. This class of oils is obtained for the most part from the Burmese coast and the Straits. These are usually procured by tapping certain trees of the order Dipterocarpeæ, and applying heat to the incision. The oil which flows from the wound, is a mixture of a balsam and volatile oil, and when applied as a varnish to wood or other substance the oil evaporating deposits a hard and durable coat of resin. They are chiefly used as natural varnishes, either alone, or in combination with coloured pigments, also as a substitute for Tar in paying the seams of shipping, and for preserving timber from the attacks of white ants. They are said also to be useful as an ingredient in Lithographic inks.

Owing to the little frequented countries from which they are brought, and the imperfect knowledge we yet possess of the country whence they are imported, the names of the trees from which these valuable substances are derived, are involved in some degree of obscurity. The oils, therefore, generally receive the names of the localities from which they are imported. Some of them differ considerably in colour and consistence, but they all possess the same balsamic odour, and are derived from various of the noble family of Dipterocarpeæ. At the Madras Exhibition of 1855, in this section, were three good samples of wood oil from Canara : also, a very interesting series of ten oils from various parts of the Madras Presidency and Burmah. Lieut Evans 51st Regt. N. I., in addition to other contributions, exhibited a bottle of wood oil from Malacca in its natural state as procured from the tree. The mode of extraction is as follows :—about the end of the dry season, that is in March or April, several deep incisions are made with an axe into the heart of the wood, and a good sized piece scooped out, into these holes fire is placed, and kept burning until the oil begins to run, when it is received into a bamboo, and allowed to run slowly drop by drop."

(8710) WOOD OIL, as obtained from the tree without any preparation. This was obtained from Malacca, from a large tree of the Dipteraceous family, which is very common in the dense jungles of the Malayan Peninsula, and grows to a great height. When not tapped too soon, the base of the trunk is often of immense girth—the wood is reddish brown and has a smell not unlike that of English fir, the bark is smooth, the leaves alternate, pinnate and exstipulate, fruit a one seeded drupe, seed angular and anatropal. The oil when permitted to remain at rest divides itself into two layers, the upper consisting of a clear chesnut colored liquid balsam and the lower being in appearance like flakes of granulated sugar and consisting probably of the surplus resin deposited by the action of the atmosphere.

(8711) WOOD OIL, GURJUN BALSAM.

Telia Gurjun, BENG. GUZ HIND.

As found in the bazars, this substance generally occurs as a brown, oily-looking, semitransparent liquid ; in odour strongly resembling a mixture of balsam of capaiba with a small portion of naptha. One kind is yielded by the *Dipterocarpus laevis*, a native of Chittagong, Pegu, Assam, &c. It has been successfully used as a substitute for balsam copaiba, to which it bears a great resemblance in its physical and chemical properties,—*Dr. O'Shaughnessy*. Gurjun Oil, is, however, the product of several species of Dipterocarpus and known, generally, as wood oil. Gurjun balsam contains fixed resin, essential oil, and water. If the latter be not separated, it boils with explosive violence. The separation

is effected by the dried muriate of lime. A small portion of the essential oil may be obtained by distillation with water in the common way. Gurjun oil is a good substitute for copaiba balsam in the treatment of gonorrhœa, given diffused through almoud mixture or gum water. Dose ten to fifteen minims repeated thrice, daily, or as often as necessary.—*Beng Phar. p.* 378.

Compound Tincture of Gurjun, is an efficient substitute for "Franks" well known specific for the treatment of gonorrhœa. Dose, twenty to thirty minims, in a little milk or sugared water. —*Beng. Phar p.* 427.

Wood oil, Kurra noona. TEL. The following is taken from Captain Halsted's account of his visit to the island of Chedooba. The wood oil tree was the most conspicuous in growth and size of the larger trees of these summits. One was felled on the west hill which measured in diameter, at the respective ends of a 60 feet length, 4 feet 6 inches, and 3 feet 6 inches; and another is left standing as a mark, on the summit which measures 21 feet 4 inches in girth at 6 feet from the ground. The wood of this tree will not, I fear, be found valuable as timber, but its produce, the wood oil, has yet to be better appreciated than at present. This substance is produced by cutting a hole into the body of the tree, and kindling a fire in it; the flat floor as it were, of the hole, has a grove cut in it, which receives the oil as it exudes from the wound, whence a split bamboo conducts it to the pots placed for its reception, the quantity thus yielded from a large tree is surprisingly great. In felling the above mentioned individual the oil ran in a stream from it, and it must have contained seven tons. The strict propriety of designating it an oil may be doubted. It has always seemed to me more like a varnish; it speedily forms a highly polished surface on wood, and has a fine aromatic scent, not unlike that of cedar: mixed with reeds and dried, it makes a brilliant and a fragrant torch. The color of the wood is a dull pink. —*Rohde M.S.S.*

(8712) WOOD OIL FROM CHINA. this valuable produce merits notice as being one of the substances of which the well-known and much prized China lacquer is made. It is used in Singapore for painting the beams and woodwork of Native houses, and may also be mixed with paint when not exposed to the sun.

(8713) WOOD OIL FROM GHITTAGONG. This substance much resembles the "Teak wood oil" and the "Wood oil from Pegu," above mentioned. It is less liquid than the latter, but is used for the same purpose; procurable in all large bazars.

(8714) *Sissoo-wood Oil—Dalbergia sissoo.* An empyreumatic medicinal product.

(8715) *Camphor-wood Oil—Dryobalanops Camphora.*—This belongs to the class of "Volatile oils," but may be here noticed. The specimen exhibited by Lieut. Hawkes was forwarded to him from Singapore through Lieut. Heath of the 38th Regiment N. I., and another excellent specimen which was exhibited by Second Dresser Pulneandy was brought by him from Labuan. It is used largely in Singapore as a substitute for turpentine, and sells at from 15 to 20 cents a bottle.

(8716) *Deodar or Shemanatahu Oil.* Tam. Erythroxylon Areolatum. An empyreumatic medicinal oil.

(8717) WOOD OIL FROM PEGU. The Botanical names of the trees yielding this wood oil cannot with any certainty be ascertained. The oil which is generally known by this name is a very clear and liquid substance forming a natural varnish when applied to wood or other substances.

(8718) WOOD OIL FROM RANGOON. This appears to differ very considerably from any other specimen of "wood oil," it is quite white and almost solid—but has the usual resinous smell of this class of oils.

(8719) WOOD OIL FROM TINNEVELLY. An empyreumatic product similar to tar, chiefly used medicinally by Native Practitioners.

(8720) *Teak Wood Oil.* A dull ash colored oil under this name, is procurable in most of the large bazars of India; when allowed to rest for some time, it separates into two layers, the one an upper dark colored clear stratum and a lower and more solid deposit. Its chief use is for applying to wood work of all sorts, either alone as a natural varnish, or in combination with certain resins.

(8721) WOOD SORREL. OXALIS.

(8722) WOOL.

Uld, DAN.	Pushm, Put, PERS.
Wol, DUT.	Welna, POL.

Wolle, GER.	Wolna, Scherst, RUS.
Oonn, GUZ. HIND.	Lana, SP.
Lana, IT.	Wull, SW.
Lana, LAT.	

The fleecy covering or pile of the sheep. Wools are distinguished by their length of staple, and by the fineness of their filaments. It is an important article of commerce, and accordingly much attention is paid to the rearing of sheep in all civilized parts of the world, so as to render their wool as perfect as possible. Wool is largely imported into Bombay from the Persian Gulf, Kurrachee, Sonmeanee, Cutch, &c., and is re-exported to England.—*Faulkner.*

India.—The table-land of the Peninsula, commencing with the Neilgherries, and proceeding along Mysore to the Deccan, Candeish, and Guzerat, presents large tracts of country affording a favourable climate, and abundant pastures for numerous flocks of sheep. If from thence we proceed in a north-east direction, passing Marwar, Malwa, Rajapootana, to the

district of Hurriana, and the province of Delhi, we shall see, supported on the natural pastures of the country, immense herds of cattle, and numerous flocks of sheep. The latter affording Wool employed by the natives for making blankets (*Kumlees*), of different degrees of fineness, which form a considerable article of the commerce of these provinces. Again, the Himalayan mountains, on their Southern face, present a European-like climate, remarkable however for being influenced by the periodical rains. The temperature varies according to the elevation; but they afford everywhere rich pastures, and support a fine breed of ship, of which the Wool is employed by the Mountaineers to form their clothing. The Northern face of these mountains is as remarkable for its dryness, as the Southern is for its moisture; the cold is excessive, and the animals which are pastured there are covered with shaggy hair, or with long Wool, and a fine down. It is here that the Shawl Wool Goat finds its most congenial climate. Mr. Moorcroft, who was deputed in 1814, to that part of Little Tibet, in Chinese Tartary, where the Shawl Goat is pastured, for the purpose of opening to Great Britain the means of obtaining the materials of the finest woollen fabric, found that the Hooneas were obliged to send all their best Wool to Cashmere. He mentions that "this is caused by strict injunctions to all the owners of flocks, not to sell any shawl-wool except to the Cashmerians or their agents, in consequence of a representation having been made to the Government, that the Jouaree merchants had bought some last year, and that the Cashmerians would suffer if any of this kind of wool were to pass into other hands." —*Moorcroft's Journey to Lake Manosarouara—Asiatic Res.* vol. lxii. In the year 1819, considerable advantage was anticipated from importing this wool into England; as a gentleman who was consulted, and who professed to have a practical knowledge of the English Wool Market, valued it at eight shillings per pound. The Byragee Wool, however, when imported was found to be unsaleable; as of 189 bales of Shawl and Bhyragee Wool, imported in the years 1821, 1822, and 1823, costing exclusive of freight and charges, £5,444, the gross sale proceeds amounted only to £809. This Wool was bought from the Hooneas, who keep sheep with the Shawl Wool Goats, by the people of Kunawur, and brought by them to Rampore, the capital of Bissehur, on the Sutlej. Specimens of the same kind of Wool, procured by Mr. Hodgson from the Booteas who visit Nepal, were forwarded to the Court of Directors of the East India Company, in 1835, by Dr. Wallich. Of this the sorted Wool was valued in London, at from 10*d.* to 11*d.* per pound; some in the unsorted state at 5*d.* to 7*d.*; and some was sold in the London market in 1834, at from 2*d.* to 7*d.* per pound; the low price was chiefly owing to its dirty and mixed state. Attention was turned in England to the subject of Indian Wool, by Mr. Southey, of Coleman Street, addressing a letter, 24th November 1836, to the Committee of Agriculture of the Royal Asiatic Society, respecting some Wool imported from Bombay. He suggested more attention being paid to the assortment of the Wool, and improvement in the breed of the sheep; and stated that last year there were imported into London 773 bags, and into Liverpool 624 bags of Indian Wool which were sold by Public Auction at 4½*d* to 1*s.* 2½*d.* per pound. The Wool was chiefly white but with black hairs occasionally interspersed; and he understood that it was produced in the province of Guzerat. In the following year, Mr. Southey again called attention to the subject, stating that the quantity exported from Bombay had enormously increased; but that what came to England was entirely of middling and secondary quality, and had, consequently, realized no higher prices than from 4½*d.* to 11½*d.* per pound. The great and rapid increase of the exports of Wool from Bombay is evident from an inspection of the following extract from the official Report of the Commerce of Bombay, for 1836-37.

"In the official year ending 30th April.

1834	.....	69,944 lbs.
1835	.....	486,528
1836	.....	1,196,664
1837	.....	2,444,019."

The report of 1837-38, goes on to say, "The quantity of Wool exported has increased from 2,444,019 lbs. to 2,700,086 lbs., valued at 98,564 rupees."

Sir A Burnes writing on wools of Cabool and Bokhara, says—1. The wool of Toorkistan, is obtained chiefly in the neighbourhood of Bokhara and Samarcand, and is more celebrated than that of Cabool. This is sent to Umritsir in the Punjab, where it is used to mix with the Shawl Wool of Tibet, in making what are called Cashmere shawls. It is the produce of the Goat of Bokhara and not of the Sheep of Toorkistan, and is called *put*, in contradistinction to *pushm*, which is used to express the fleece of the Sheep. 2. The wool or Put of the Goat of Cabool is not at present exported being entirely consumed in the Native Manufactures. It is procured from Goats, and chiefly from the Hill Country of the Huzaras to the West of Cabool, and between that city and Herat, which has an elevation of about 6,000 or 8,000 feet above the level of the sea. 3. The countless flocks of flat-tailed Sheep in Cabool, produce an abundance of Wool. The fleece is of a glossy white colour, and is in Cabool called *pushmi burra*, and the fabrics prepared from it *burrak*, in contradistinction to *puttoo*. It sells at from two and a half to two

Cabool Rupees the seer, or sixteen pounds. It is brought in from all directions for sale in Cabool, and Sir A. Burnes states that he "can scarcely put a limit to the supply, since the extent of pasture land in these countries is not over-rated at four-fifths of the whole surface of the country, and a very large portion of the population, such as the Lohanees and Ghilgees, are shepherds, who remove from pasture to pasture, and rear their flocks with great care and attention. Nature, however, does as much as the people; for aromatic plants, in which sheep delight, are exceedingly abundant, and it is universally believed that they have considerable effect on the quality of the Wool."

Good Ewes appear to be obtained in Coimbatore and Baramahal; but Jalna and Beder are mentioned as the best places whence to obtain the white-wooled breed. The results obtained both at Bangalore and on the Neilgherry Hills, from crossing the white-wooled sheep of the country, with Saxon, Merino and South-down rams, are stated to be most satisfactory, both as to quantity and quality of Wool, and size of carcase.—*Royle's Productive Resources of India.* At the Madras of Exhibition of 1855, of specimens of Woollen Manufactures, the most remarkable were those from Hoonsoor, comprising white and colored blankets of various textures made in the Native loom, some being imitations of English Articles, and a decided improvement upon the country cumbly, and cheap in price. Among them was the description of blanket furnished to Invalids and time-expired men proceeding to England. These are not manufactured for the European Troops, being too thick, heavy and unsuited to the climate. English blankets are therefore provided instead; the comparative cost is as follows:

1	Hoonsoor Blanket.	...	1	12	0
1	Europe do.	red ...	4	8	0
1	Do. do.	white	5	8	0

The Jury considered this manufacture worthy of encouragement, and observed that means should be devised to improve the Manufacture especially as wool is abundant. The description of wool from which these were manufactured is of recent introduction. In the Mysore country "Sheep "thrive well, but the wool is coarse, and little "used except for the manufacture of Native "Blankets. About 10 years ago, General Cubbon took charge of a flock from the Madras "Government, which had been collected the "year previously for the purpose of introducing Merino wool into the country; but that "flock was useless, it having been attacked with "rot. He then collected one at a farm about "60 Miles West of Bangalore, and imported 3 "or four Rams annually from Sydney, these amalgamate so well with the country sheep, both in "figure and size, that in the 4th cross it is not "possible to distinguish farm bred from the "imported Ram. There are now about 6000 "sheep in Mysore, with merino blood in them. "Rams from the farm have been distributed to "the Collectorates of North Arcot, Bellary, "Salem and Coimbatore. During last year 25 "Rams were sent to the Punjaub, by order of "the Government of India. The wool has been "very highly reported on by Messrs. Southey "and son, and several parcels have been sold in "London as high as 1 shilling and 6 pence per lb. "while the country wool, and that imported "from Bombay, averages only 4*d.* to 5*d.* per lb, "There can be no doubt that when the Merino "sheep is naturalized, wool will become a valuable article of Export. A mercantile firm in "Bangalore, has recently exported the wool of "the Mysore country to England, in considerable quantity, and has realized a very fair profit. Eventually the Merino will be produced as "cheaply as ordinary wool." The quantity and value of wool annually exported from Madras is lb. 1,28,413, value Rupees 15,816. A very large black cumbly from Kurnool was considered an excellent specimen closely woven, fine and soft in texture, and to this the Jury awarded, as the best specimen of the ordinary woollen manufactures of the country, a second Class Medal. A check Cumbly, from Chittledroog, was found deserving of honorable mention. The best specimen of woollens was found in the Tariff, being a blanket made of corded wool of excellent quality and reasonable in price. A red cumbly of Mysore, was exhibited in this collection and was of good quality. (Sd. W. E. Underwood, *Reporter.*)

At the great Exhibition of 1851, some fine merino wool was exhibited from the table-land of Mysore, and indigenous wools from the hilly country of the north-west frontier. Some from Lahore, and other kinds from the dry and cold elevated climate of Tibet. Of the last, were some very fine specimens from Lieut. Strachy. Many of the animals there being furnished with a fine down or hair-like wool under the coarse common outer wool. It is this which is chiefly employed for the shawls and the shawl wool cloth. Though woollen fabrics of superior quality are not likely to be fabricated in a hot country like India, yet as there are great diversities of climate in the different parts of Eastern and Southern Asia, some very substantial woollen cloths and blankets are made in different parts, amongst others, fine shawl-wool cloth in Cashmere; also the kind called Puttoo; a fabric, named *Pursepuz*, the pile of which, on one side, is formed of loops. Felted blankets and cloaks have been manufacted from the table land of Mysore, as well as from the north-west frontier, and from Nepal and Tibet.—*Royle, Arts &c. of India, page* 498.

China. The only woollen fabrics produced by the Chinese are felts for the soles of shoes

and winter hats, and a sort of rag or carpet. It is not woven in looms from the yarn, but is made in small pieces by a fulling process which mats the fibres together. The consumption of it by shoe-makers is very great, and nearly as large for winter hats among the common people. The rags are woven with colored threads in rude imitation of figures, and are extensively used in the northern provinces; the pieces are a few feet square, and sown together for carpets or bedding. Hair and wool are both employed in their construction. The art of knitting is unknown, and of course also the fancy designs and worsted work which are made by ladies in the west.—*Williams' Middle Kingdom, Vol.* II *page* 126.

(8723) WOTAY KOROSHANUM.

Wotay Koroshenam, TAM. | Wontay Koroshnam, TEL.

This is a bright yellow, biliary concretion, found in the gall bladder of certain camels. It is highly prized as a beautiful yellow paint, but is very expensive.—*Ainslie.*

(8724) WOOTZ OR INDIAN STEEL. The ore from which it is made is the magnetic oxide which is combined with quartz, generally in the proportion of 48 parts of quartz to 52 of oxide of iron. It is found in many parts of the south of India, but Salem is the chief seat of the manufacture, and there the ore is prepared by stamping and separating the quartz either by washing or winnowing. The furnace in which the ore is smelted is from three to five feet high from the surface of the ground, and the ground is hollowed out beneath it to the depth of eight inches or a foot. It is somewhat pear shaped, being about two feet diameter at the ground and tapering to about one foot diameter at the top: it is built entirely of clay, two men can finish one in a few hours, it is fit for use the next day; the blast is furnished by a pair of bellows each being a goat skin with a bamboo nozzle: a semi-circular opening about a foot and a half high and a foot in diameter at the bottom is left in the furnace and before each smelting it is filled up with clay: the furnace is then filled up with charcoal, and kindled, a small quantity of ore, previously moistened to prevent its receiving the charcoal, is laid on the top of the fuel, and charcoal is thrown over it to fill up the furnace: in this manner ore and fuel are added and the bellows plied for four hours or thereabouts when the process is stopped, and the temporary wall in front of the furnace having been broken down the bloom is removed by a pair of tongs from the bottom of the furnace and is then beaten with a wooden mallet to separate as much of the vitrified oxide as possible: and, while still red hot, it is cut through with a hatchet and in this state sold to the blacksmiths who perform all the subsequent operations of forging it into bars, and making it into steel. The process of forging into bars is performed by sinking the blooms in a small charcoal furnace and repeated heatings and hammerings to free it as much as possible from the vitrified and unreduced oxide of iron: it is thus formed into bars about a foot long, an inch and a half broad and about half an inch thick. In this state it is full of and exceedingly red short. These bars are cut into small pieces to enable them to pack in a crucible. A quantity amounting to a pound and a half to two pounds is put into a crucible along with a tenth part by weight of dried wood of the Cassia auriculata chopped small; these are covered with one or two green leaves of the calotropis (asclepias) gigantia or cow obulas laurifolius and the mouth of the crucible filled up with a handful of tempered clay which is rammed so as to exclude the air perfectly. As soon as the clay is dry twenty to twenty four of the crucibles are built up in form of an arch with their bottoms inwards, in a small furnace urged by two goat skin bellows, charcoal is heaped up over them, and the blast kept up without intermission for about two hours and a half when it is stopped and the process is considered complete. The crucibles are removed from the furnace and allowed to cool, they are then broken and the steel which has been left to solidify is taken out in a cake having the form of the bottom of the crucible. When the fusion has been perfect the top of the cake is covered with striæ, radiating from the centre but without any holes or rough projections on it: When the fusion has been less perfect the surface of the cake has a honey-combed appearance, caused probably by particles of scoriæ and unreduced oxide in the bar iron, and often contains projecting lumps of iron still in the malleable state. The natives prepare these cakes of steel for being drawn into bars by annealing them for several hours in a charcoal fire actuated by bellows, the current of air from which is made to play upon the cakes whilst turned over before it at a heat just short of that sufficient to melt them, by this means the excess of carbon is detached (*Mad. Lit. Journ*) The process of smelting iron differs according to circumstances in different parts. In some, the ore is collected in the form of sand from the beds of rivers; the iron stone is collected either from the surface or from mines.—*Rohde, M.S.S.*

(8725) WORMWOOD, INDIAN. ABSINTHIUM WOOD.

Afsunteen ARAB.	Domolo, JAV.
Gundmar, CASH.	Dona, SANS.
Wael-kolundoo, CYNG.	Buranjasif kowhei, PERS.
Dhowna, Mustaroo, Murwa, GUZ. HIND.	Mashipattiri, TAM.

A perennial herb (*Artemisia Absinthium*) indigenous to Britain, celebrated for its intensely bitter tonic, and stimulating qualities. The wormwood met with in the bazars in India, is chiefly the produce of Persia, whence it is largely imported into Bombay by way of the Persian Gulf.—*Faulkner.*

(8726) WRIGHTIA, a genus of plants belonging to the natural order *Apocynaceæ*, named after Dr. William Wright. It has a 5-parted calyx, a salver-shaped corolla with the throat crowned by ten divided scales; the stamens exserted, attached to the throat of the corolla, and the anthers sagittal, cohering by their middle to the stigma; the ovaries two, cohering; the style single, filiform, dilated at top; scales five to ten in number, seated at the base of the calyx outside the corolla: the follicles distinct or combined with adnate placentas. Dr. Wight gives Wrightia coccinea, 442; *piscidia*, 472; Rothii, 1319; tinctoria, 444; Tomentosa, 443; Wallichii, 1296.

(8727) WRIGHTIA COCCINEA. APOCYNACEÆ. A large tree; flowers externally green, internally deep orange red, having something of the perfume of the pine-apple.—*Riddell.*

(8728) WRIGHTIA MOLLISSIMA. Introduced from the Naggary Hills; the yellow juice might be turned to account, but the timber is of no value.—*M. E. J. R.*

(8729) WRIGHTIA ANTIDYSENTERICA. NERIUM ANTIDYSENTERICUM. Echites antidys: Roxb.

Veppaula, TAM.	Inderjan, HIND.
Pala chettoo TEL.	

Found in the hill jungles of Kotah and Mewar, and a small tree of common occurrence in Mysore and the hilly parts. A native of the coast of Malabar, of Ceylon, and the Isle of France, and common in many parts of India. Tiwaj and Lisan ul-asafeer, *Arab.* Anduraroon, *Greek.* Seeds called *Indurjuo-i-shereen*, or the mild, to distinguish them from seeds of *Holarrhena pubescens*, and *Antidysenterica*, called *Indurjuo-i-tulkh*, or the bitter. A small shrub, leaves ovate oblong, or exactly oblong, shortly acuminate, smooth, bright green on each side.

The bark (*conessi bark*) is astringent and bitter, and also deemed febrifuge. The seeds, *Indurjuo*, are intensely bitter and used as a vermifuge.

Conessi bark has been given with much alleged advantage in chronic dysentery. The infusion seems the best form, 4 drachms of the dried and powdered bark being infused in 8 ounces of hot water for an hour:—dose one ounce thrice daily.—*O'Shaughnessy, p.* 445. Its medicinal virtues are worthy of attention, but the wood is of little value. The bark was formerly in request under the name of *Conessi* and is still esteemed a valuable drug by the natives. It appears to have lost its value in commerce, from not being distinguished from the bark of Wrightia tinctoria which grows in the same places. —*M. E. J. R.*

The Wood.

Palavarance or palay wood, ENG.	Doodheei ke lakree, HIND.
Palava renoo, TEL.	Veppallay, TAM.

The tree has sweet-scented flowers with a form resembling those of the Jasmine. The wood is white, of a fine grain, and susceptible of polish, and is used by the turner and cabinet-maker. The bark of this shrub, which goes by the name of Conessi bark in Great Britain, and Palapatta in India, is asserted to be specific in dysentery and of use in most disordered states of the bowels. Its milky juice is also used as a vulnerary.—*Eng Cyc.*

The Bark.

Conessi bark is the produce of a plant belonging to the natural order *Apocynaceæ*, a native of the Western coast of Hindustan. It is the *Wrightia* (Nerium) *antidysenterica*, and is a valuable astringent.—*Engl. Cyc. page* 122. Mr. Faulkner describes it as a native of Ceylon, Mauritius, the Malabar Coast, and many other parts of India. It is astringent and bitter, and is considered febrifuge; it has also been given with alleged advantage in chronic dysentery. The seed of the plant are termed *Indrojow*. —*Faulkner.*

The Seed.

Lisan ul assafeer, ARAB.	Indrayava, SANS.
Indrajow, GUZ. HIND.	Veppalei arisee, TAM.
Abir, PERS.	

The seed of Wrightia antidysenterica (*Nerium antidysentericum*), are covered with a kind of downy tuft, somewhat resembling the down of the thistle Two kinds of Indurjuo seeds are distinguished, the *sweet* and *bitter*. The former, *Wrightia*, has a pleasant taste not unlike that of oats, which they also resemble somewhat in appearance; but are longer and more slender. An infusion of this roasted seed is given as a safe and gentle restrainer in bowel complaints; the decoction is employed in fever cases. The latter, *Holarrhena*, are intensely bitter, and used as a vermifuge.—*Faulkner.*

According to the Ind. Ann. Med. Sci. for Apl. 1856, p. 397. The bark of this tree, which was once introduced in the London Ph. as Conessi bark and was greatly lauded more than a century ago by Geoffroy, known also as Codaga and as Koorchee has long been a popular remedy on the Malabar and Coromandel Coasts, and also in Bengal in dysentery, and from a somewhat extensive trial which was made of it in that disease, of which it is hoped to be able to publish the results, it appears to be a remedy of no mean value. It has however been also known on the Malabar Coast and among the Portuguese there as a febrifuge, under the name of corte de palla. Dr. Cleghorn informs that several Medical officers in the Northern Circars have been administering it of late. We have no knowledge of its febrifuge virtues, but it seems to have fallen into disuse from carelessness in selecting the bark, and it may deserve a further trial. An infusion

of the seeds called indrijau has been called febrifuge but is only demulcent. The most common and convenient way of administering koorchee is to give 1½ to 2 oz. of decoction three times daily.

(8730) WRIGHTIA TINCTORIA. Apocynaceæ, Icon. 444.

Pallay marum, TAM. | Kala Kooda, HIND.

A small tree with pale green soft leaves; deciduous in the cold weather. On being bruised, a kind of Indigo exudes from them. Flowers in March and April; white follicles in pairs, from twelve to eighteen inches long, which as they ripen the ends of each pair curiously join. Th wood is used by turners and cabinet-makers.—*Riddell.* It is a common tree in the Coimbato jungles, where it attains a considerable siz wood white and close-grained; in the words Roxb. "coming nearer to ivory than any I know. It is not however much in use here.—*Wight.*

(8731) WRIGHTIA WALLICHII, Wig states, is found on "the slope of the Neilgherrie from about the middle of the ascent to the el vation of between 4000 and 5000 feet;" but "th original specimens of this species were collecte in the Tenasserim provinces."—*Mason.*

X.

(8732) XANTHOXYLACEÆ, *Xanthoxyls*, a natural order of Exogenous Plants. The flowers are unisexual and regular; the calyx in three, four, or five divisions; the petals usually of the same number as the divisions of the calyx, usually longer than the calyx, and sometimes absent: the æstivation is generally twisted and convolute; the stamens are equal in number to the petals, or twice the number, and arise from around the base of the stalk of the abortive carpels; in the female flowers they are either absent or very imperfect; the ovary is made up of the same number of carpels as there are petals, or of a smaller number; the carpels are either distinct or more or less combined; there are mostly two ovules in each cell, sometimes four: the styles are more or less combined, according to the cohesion of the carpels; the fruit is either membranous or in the form of a berry, sometimes having from 2 to 5 cells, and sometimes consisting of several drupes or 2-valved capsules, of which the sarcocarp is fleshy, and is easily separated from the endocarp; the seeds are solitary or twin, peduncles usually smooth and shining with a testaceous integument; the embryo lies in the midst of a fleshy albumen, radicle superior, and the cotyledons ovate or flat. The species of plants belonging to this order are trees or shrubs, with exstipulate, alternate, or opposite leaves furnished with pellucid dots. The flowers are either axillary or terminal, and coloured gray, green, or pink. The plants in this order were included originally by Jussieu in his *Terebinaceæ*. They were first separated by Martius and Nees under the *Xanthoxylaceæ*, which was subsequently adopted by Adrien de Jussieu. The species of *Xanthoxylaceæ* are found chiefly in America, especially in the tropical parts. A few of the species are found in Africa, in Mauritius and Madagascar, in India and China. One only is a native of Australia. All this order, to a greater or less extent, possess aromatic and pungent properties. The species which are best known and used on account of these properties belong to the genera *Xanthoxylum*, *Brucea*, *Ptelea*, *Toddalia* and *Ailanthus*. The species of *Ailanthus* are large trees, and their timber is used for various purposes in the countries in which they grow. *A. glandulosa* is a native of China and the Moluccas, where it is called Ailanto. It attains a height of 60 feet. When the bark is wounded it gives out a resinous juice which hardens in a few days. The wood is hard and heavy, and is susceptible of a very fine polish. It grows well in England. *A. Malabarica* is a large tree, a native of Malabar. The wood is used for making sheaths for spears, &c. A resinous juice flows from the bark when wounded. The fruit is triturated with maize and mixed with rice in decoction, and used as an application in ophthalmia.—*Eng. Cyc.* The Cosmetic Wood of Mergui is from one of the *Xanthoxylaceæ* and is a fragrant cosmetic wood sold in the bazar, which is said to come from Mergui, but Mr. Mason never saw the tree.—*Mason.*

(8733) XANTHOCHYMUS, a genus of Plants belonging to the natural order *Guttiferæ*. Of these the *X. pictorius* is the most important. This plant is the *X. tinctorius* of Linnæus. It has lanceolate acuminate leaves, wrinkled petioles, and fruit 1-4-seeded. It is a native of the East Indies, in valleys among the Circar Mountains.—*Eng. Cyc.*

(8734) XANTHOCHYMUS PICTORIUS.

Eeswara mamede, CING. | Dampel, TEL. Rata, GHORKA.

A beautiful tree of the Mountainous districts of India, yields a green fruit and a large quantity of indifferent gamboge.—*Rohde, M. S. S.*

(8735) XANTHOCHYMUS. YELLOW MANGOSTEEN. Roxb.

Malay Chucan pullum, TAM. | Bryonia SPEC. Geeri Gotoomba, SANS.
Pedda Boodumalapindoo, TEL. | Malay Poollie pullum, TAM.

Ainslie says he met with this fruit at Quilon

where he was told that it was brought from the distant woods. It is in appearance like a Mango, but flatter and two or three large seeds (or stones) are contained in each, somewhat resembling jack stones. The fruit itself has an acid but pleasant taste and when cut, there exudes a yellow juice like liquid Gamboge. It appeared to be very little known to the European inhabitants of Travancore. They have on the Malabar coast a variety of the real Mangosteen (Garcinia Mangosteena); it is however very inferior to that of the Eastern islands and affords a yellow gum-resin, which is not soluble in water.—*Ainslie, page* 227.

(8736) XANTHOXYLON ALATUM. (Roxb. El. Ind. 768.)

Durmur. HIND.

A native of Nipal, and the hilly countries north of Bengal, Rohilcund, and Oude, flowering in Calcutta in the hot and rainy seasons. Roxburgh states that every part of the plant possesses a peculiar aromatic pungency, and that the seeds are used medicinally by the natives.

(8737) XANTHOXYLON AVICENNÆ, (*Fagura A.*) a native of China, is a powerful stimulant, and used as an antidote against poisons.

(8738) XANTHOXYLON BUDRUNGA.

Toung-than; also Young-thaujee, BURM.

Is a native of the East Indies, in Silhet, and is called Budrung; and the natives use the seeds, which have a warm spicy flavour, medicinally. The fruit is about the size of a pea, and the outer coat contains an exceedingly fragrant balsam.—*Eng. Cyc.* It is a small thorny tree, the dry capsules of which are found in the bazars of India, under the name of Kek-ka-la. The seed abounds in a rich aromatic oil. The bark and large thorns of the trunk are the Tejbul of India. The tree is about twenty feet high in the Pegu and Southern parts of the Tounghoo districts, where it grows upon the banks of streams. —*McClelland.* This plant, found in the Pegu and Southern parts of the Tounghoo districts, affords a plentiful supply of oil-seeds, which has not, as yet, he believes, been taken advantage of as it deserves.—*McClelland.*

(8739) XANTHOXYLON HOSTILE. XANTHOXYLUM AROMATICUM, is a tree found in the Himalayas and in the mountains of Cashmere. Its branches are as thick as a finger, serve the natives as tooth-brushes; thicker branches are used by the faqueers as walking sticks, also to triturate the hemp plant, in preparing their beverage. In using a triturator possessing pepper like aromatic qualities, they save the pepper which is usually added to the hemp plant. The capsules and seeds are employed for intoxicating fish, and are chewed as a remedy in toothache (Royle). Besides the seeds, Honigberger used the bark, together with the sharp prickles which are attached to it by large bases.—*Thirty five years in the East by Honig. page* 365. The capsules and seeds of X. hostile, called Tejbul by the natives, are used in India for intoxicating fish and are supposed to be the Faghureh of Avicenna.—*Eng. Cyc.*

(8740) XANTHOXYLON PIPERITUM. In Japan the capsules of X. piperitum are used as a substitute for pepper. The fruits of many of the species are also held to be antidotes to the action of poisons on the system, and there can be little doubt that the secretions of these plants would be found valuable stimulant remedies in many diseases.—*English Cyclopædia, page* 1263. *Xanthoxylon piperitum*, is a powerful aromatic, used by the Chinese in the room of ginger and pepper. The active principle resides chiefly in the fresh leaves, the dry bark, and the pericarp. The physicians of the country apply a poultice made of the bruised leaves and rice flour in sore throats. For the preceding details Dr. O'Shaughnessy was indebted to Lindley's Flora Medica, p 215. Royle further informs us, p. 157, that in India *X. Budrunga, Rhetza alatum*, and *hostile*, are used wherever indigenous for the warm, spicy, pepper-like pungency of their capsules, a property which is participated in by their bark and other parts. The capsules and seeds of X. hostile, called *tejbul* by the natives, are employed in Northern India for intoxicating fish, and chewed as a remedy in toothache. They are also described as the Faghureh of Avicenna.—*O'Sh., page* 642.

(8741) XANTHOXYLON RHETSA, is a native of the mountainous parts of the coast of the East Indies, and in the Tamul language is called Rhetza-Marm, which means Council-Tree, as it is under the branches of this tree that the hill people assemble to discuss all matters of public interest.—*Eng. Cyc. page* 1863.

(8742) XANTHOXYLON TRIPHYLLUM. A resin is obtained from this tree. Judging from the specimens it appears to be produced in too small quantities to be useful in a commercial point of view.

(8743) XIMENIA ÆGYPTIACA.

HINGEN; HINGOT HIND:

Grows in the Kotah district: the nut shell is used to make crackers in fireworks.—*Gen. Med. Top. p.* 109. Wight gives *Ximenia olacioides*, 1861.

(8744) XYLOBALSAM. An inferior quality of opobalsam, obtained from the fruit and twigs of the (*Amyris Gileadensis*), that yields the superior quality.—*Faulkner.*

(8745) XYLCOCARPUS (from ξύλον, wood, and καρπός, fruit), a genus of plants belonging to the natural order *Meliaceæ*. The genus, with *Persoonia*, has been referred by Aublet and other botanists to the genus *Carapa*.—*Eng. Cyc.*

(8746) XYLOCARPUS GRANATUM: CARAPA MOLUCCENSIS, (Lamarck). Roxb. Flora Ind. ii. 240 *Beng.* Pussoor—a native of the Sunderbuns. Fruit ripens in June and July.

The Carapa of Guiana was first described by Aublet. It yields fruits, the almonds of which are white, solid, oily, and bitter. The oil he described as being used by the Galebi savages to anoint their skins and hair, in order to keep off insects. Rumphius described a similar but smaller tree in the Moluccas, under the name of "Madahul," or "*Granatum litoreum.*" This Willdenow described as Xylocarpus granatum. The Xylocarpus is mentioned as a tree with elegantly veined wood, used in India in cabinet work, and its bitter root being employed in bilious fevers. A starchy substance, used as an article of food, is also found beneath the bark of the capsule.—*O' Shaughnessy, page* 246. This the sea-cocoanut of Tenasserim, *Xylocarpus Granatum*, is not the famous *Cocos des mer* of the Seychelles, so long the wonder of the world; but a tree very common in the mangrove swamps; and growing near the shore, its fruit falls into the water and floats out upon the sea, which gives rise to its name. The fruit is not edible, but is exceedingly astringent, and regarded by the natives as a specific in cholera. —*Mason.*

(8747) XYLOPHYLLA ANGUSTIFOLIA, EUPHORBIACEÆ. This is a small shrub growing to the height of three feet, the color of the flowers is yellow and red.—*Riddell.*

(8748) XYRIDAGEÆ, *Xyrids*, a natural order of Endogenous Plants. The species are herbaceous plants with fibrous roots. The leaves are radical, sword-shaped, scarious, dilated and equitant at the base. The flowers are arranged in terminal naked imbricated heads; the calyx is glumaceous, 3-leaved; the corolla petaloid coloured, with 3 petals; the stamens 6; 3 fertile inserted upon the claws of the petals; 3 sterile alternate with the petals; the anthers 2 celled and turned outwards; the ovary single, the style bifid; the stigmas multified or undivided; the capsule 1-celled, 3-valved, many-seeded, with parietal placentæ; the seed with the embryo on the outside of the albumen, and at the end most remote from the hilum. As at present constituted, this order comprises only the genera *Xyris* *Abolboda.* The species of these genera are found generally in the hotter parts of the world, chiefly in the tropics of America, Asia, and Africa. Some of the species of *Xyris* are found in the southern states of North America. *X. Indica* is said by Agardh to be used as a remedy in itch and leprosy.

(8749) XYRIS INDICA. A species of Xyris with conspicuous yellow flowers on imbricated scaly heads, is often seen in the Tenasserim paddy fields.—*Mason.*

Y.

(8750) YAK. The yak is a very tame domestic animal, often handsome and a true bison in appearance. It is invaluable to the mountaineers of Northern India, from its strength and hardiness, accomplishing at a slow pace, 20 miles a day, bearing either two bags of salt or rice, or four to six planks of pine wood slung in pairs along either flank. Their ears are generally pierced and ornamented with a tuft of scarlet worsted, they have large and beautiful eyes, long silky black hair, and bushy tails: black is their prevailing colour, but red, dun, party coloured and white are common. In winter, the flocks graze below 8000 feet, on account of the great quantity of snow above that height; in summer they find pasturage as high as 17,000 feet consisting of grass and small tufted carices, on which they browse with avidity. Much of the wealth of the people in East Nepal consists in its rich milk curd, eaten either fresh or dried, or powdered into a kind of meal. The hair is spun into ropes, and woven into a covering for their tents, which is quite pervious to wind and rain, though in the dry climate of Tibet this is of little consequence. The bushy tail forms the well known chowree or fly flapper of the plains of India, and its hair is greatly esteemed by the women of the plains to add to their back hair. The female drops one calf in April, and the young yaks are very full of gambols, tearing up and down the steep grassy and rocky slopes. Their flesh is delicious, much richer and more juicy than common meat, that of the older yaks is sliced and dried in the sun, to form jerked meat, called schat-t-chew dried meat, which is eaten raw, and is a palatable food. The yak loves steep places delighting to scramble among rocks, and to sun its black hide perched on the glacial boulders which strew the Wallanchoo flat, and on which these animals always sleep. Their average value is from two to three pounds. The yak though indifferent to ice and snow, cannot endure hunger so long as the sheep. Neither can it bear damp heat. The yak is ridden and its pace is easy. The wild yak or bison (D'hong) of Central Asia, the superb progenitor of the domestic yak is the largest native animal of Tibet, in various parts of which country it is found. It is untameable and horridly fierce, falling on the hunter with horns and chest, and if he rasps with his tongue it is so rough as to scrape the flesh from the bones. It is hunted by large dogs,

and shot with a blunderbuss, the horn is used as a drinking cup in marriage feasts and other grand occasions.—*Hook. Him. Jour. Vol.* I *p.* 215.

(8751) YAMANEE. There is a tree on the hills of Tenasserim which furnishes a remarkably light, white timber, resembling mootchee wood, of which the natives often make canoes. The Karens say it bears a yellow flower, and a small plum, which is a favorite food with the barking deer.—*Mason.*

(8752) YAMS. The different species of yams have a wide range. In the West Indies there are several varieties, having distinctive names, according to quality, color, &c., as the white yam, the red yam, the negro yam, the creole yam, the afoo yam, the buck yam, (*Dioscorea triphylla*), which is found wild in Java and the East; the Guinea yam, the Portuguese yam, the water yam, and the Indian yam, &c. The last is considered the most farinaceous and delicate in its texture, resembling in size the potato; most of the other sorts are coarse, but still very nutritive and useful. The common yam (*Dioscorea sativa*) is indigenous to the Eastern Islands and West Indies. The Guinea yam *D. aculeata*, is a native of the East. The Barbadoes or winged yam (*D. alata ?*) has a widely extended range, being common to India, Java, Brazil. *Yams* of Western Africa. The yam species are climbing plants, with handsome foliage, of the simplest culture, which succeed well in any light, rich, or sandy soil, and are readily increased by dividing the tuberous roots. The Indian, Barbadoes, and red yams are planted in the West Indies early in May, and dug early in the January following. If not bruised, they will keep well packed in ashes, the first nine, and the second and last twelve months. The Portuguese and Guinea yams are planted early in January and dug in September. Creole yams and Tanias are dug in January. Sweet potatoes from January to March. In most of our colonies large crops of the finest descriptions of yams, cocos &c., could be obtained, but the planting of ground provisions is too much neglected by all classes. From the tubers of yams of all sorts, and particularly the buck yam, starch is easily prepared and of excellent quality, Some varieties of the buck yam are purple fleshed, often of a very deep tint, approaching to black, and although this is an objection, because it renders more washing necessary, yet even from these the starch is at last obtained perfectly white.

As an edible root the buck yam, especially when grown in a light soil, is equal to the potato, if not superior to it. It does not, however, keep for any length of time, and therefore could not be exported to Europe, unless the roots were sliced and dried. Yams and sweet potatoes thrive well in the northern parts of Australia; indeed the former are indigenous there, and constitute the chief article of vegetable food used by the natives. The yam was introduced into Sweden, where it succeeded well, and bread, starch and brandy, were made from it: but it prefers a warmer climate. Yams are occasionally brought to England. When cooked either by roasting or boiling, the root is even more nutritious than the potato, nor is it possessed of any unpalatable flavor, the peculiarity being between that of rice and the potato. Dressed in milk, or mashed, they are absolutely a delicacy, and from the abundance in which they are cultivated in the West Indies, and other parts, they promise to become a most economical and nutritious substitute for the potato. The yam frequently grows to the enormous size of forty or fifty pounds weight, but in this large state it is coarse flavored and fibrous. An acre of land is capable of producing 4½ tons of yams, and the same quantity of sweet potatoes, within the twelve months, or nine tons per acre for both, being nearly as much as the return obtained at home in the cultivation of potatoes; and we have the authority of all analytical chemists for saying that in point of value, as an article of food, the superiority is as two to one in favor of the tropical roots. The kidney rooted yam (D. pentaphylla), is indigenous to the Polynesian islands, and is sometimes cultivated for its roots. It is called Kawan in the Feejee islands. D. Bulbifera, a native of the East, is also abundantly naturalised in the Polynesian islands, but is not considered edible. There are seven or eight kinds of yams grown in India. Two found in the Tartar country are of a remarkable fine flavour, one weighing as much as eighteen pounds the other three pounds.—*Simmonds' Comml. Product, p.* 363 & 4. See Cocos or Eddoes, also Dioscorea.

(8753) YANG-TSE-KIANG RIVER. The rise and fall in the Yang-tse-Kiang averages about ten feet and vessels are obliged to find their way hap hazzard into the channel or perchance run upon one of the silted sands.—*American Expedition to Japan, p.* 166.

(8754) YARN. Twist.

Garen, Dut.	Filato, It.
Fil, Fr.	Fio. Port.
Garn, Ger.	Prasha, Rus.
Soota, Guz. Hind.	Hilo, Sp.

Wool, Cotton, Flax, &c. spun into thread. Its quality is expressed in English by numbers denoting the number of hanks in an avoirdupois lb. weight; reckoning the length of the hank of cotton yarn at 840 yards, or 7 leys of 120 yards each.—*Faulkner.*

(8755) YARVINEY, in Tamil and Crawn in Portuguese and Dutch. This Ceylon tree grows tall and straight, from twenty to forty-five feet high, and from twelve to thirty inches in diameter. It may be obtained in great quantities, and answers many purposes in ship and house-work.—*Edye. Ceylon.*

(8756) YASHM. The Messrs. Schlagentweit found the quarries of this mineral at Gulbagashen

in the valley of Kara kash, in their Journey from Ladak to Khotam.—*Mag. Survey* 1857.

(8757) YAVY.

Yavayloo, Tam. | Yeva Sans, Tel.

This grain grows in some of the more northern provinces, and has an appearance something like that of blighted wheat, it is not very valuable.—*Ainslie page* 220.

(8758) YEAST, Barm. A product of the fermentation by which beer is made; upon the surface of which it swims from involving bubbles of carbonic acid gas. It may be obtained in the form of a firm paste. Mixed with moistened flour, it excites the panary fermentation, and is thus used for baking bread.—*Waterston.* The substance known as Yeast, is in reality a plant, belonging to the Tribe of Fungi in the state of sporules or thallus: or the true aerial tufts or heads of sporules, of a multitude of minute oval or circulating bodies or sporules, endowed, under certain favourable circumstances, with extraordinary powers of growth and multiplication. In Britain, three kinds, viz. brewer's yeast, German yeast, and patent yeast, are employed in the manufacture of bread; In India, the yeast employed, is the fermented juice of the Palms, known as Toddy. The vitality of yeast is destroyed by falls, blows, bruises or rough mechanical injuries, as also—heat, cold, and chemical re-agents. The presence of yeast in a substance containing sugar, or starch convertible into sugar and nitrogenised matter, induces certain chemical changes comprehended under the term vinous or alcoholic fermentation. These changes in the making of bread consists in the conversion of sugar of flour into alcohol and carbonic acid gas; the latter, in its efforts to escape from the dough with which it is mixed, distends it, forming vesicular spaces in its interior, and so causing it to become porous and light.

Yeast is found on the surface of fermenting liquids, and when removed capable of producing fermentation in other liquids susceptible of this action. On placing Yeast under the microscope it presents a number of cells immersed in a mass of amorphous matter. The cells are sometime single, and at other times several are united together in a kind of chain. These cells are supposed to partake of a fungoid character, and they have been called the Yeast-Fungus, or Ferment-Cells. A genus and species have been constituted for the reception of this organism, under the name of *Saccharomyces Cerevisæ*. This plant has been supposed to be the active cause of fermentation, and the carbonic acid given off during that process has been regarded as the result of the growth of the plant. This seems to be a misinterpretation of the phenomena, as the plant is probably the result of the carbonic acid given off during the process of fermentation rather than its cause. Schleiden supposes that these ferment-cells originate in liquids, independently of other cells, and are truly instances of the formation of cells in a free fluid. He observes however that they have no power of reproducing other cells. The whole subject of the nature of these cells, their mode of production, and the history of their development, as well as the phenomena of fermentation in general, require further elucidation. (Schleiden, *Principles of Scientific Botany*; *Micrographic Dictionary*, articles 'Fermentation,' 'Torula,' 'Yeast.'

(8759) YELLOW-HAMMER, the common name for the *Emberiza citrinella*. Linn. Pennant quotes the Bruant of Belon (L'Histoire de la Nature des Oyseaux,' p. 366) as this species, and the description seems to warrant the quotation. Belon considers the bird to be the Ἀνθος of Aristotle ('Hist. Anim,' ix. 1), and remarks that the Greeks of his time did not call it by the ancient appellation in their tongue, but by the Latin name *Florus*, "car ils ont este dominez par les Latins, dont ils ont retenu telle diction." It is the Bruant of the French generally; Serramolle and Zivolo di Testa Gialla of the Italians: and, according to the 'Portraits d'Oyseaux,' Hortolano, Cia, Megliarina, Verzerot, Paierizo, and Spaiarda of the same people. It appears to be the Groning and Golspink of the Swedes; Goldammer, Ammering, and Goldammering of the Germans; Geel-Gerst of the Netherlanders; Yoit, Yellow-Yoldrin, Yellow-Yowley, and Yellow-Yeldrock of the English: and Lilnos Felen of the Welsh. These birds are caught and fatted for the table with the Ortolan in Italy, whence probably one of the Italian names above noticed.

(8760) YELLOW-WOOD. There is a fine East India wood thus called, it appears to be larger and straighter than box wood, but not so close grained. I should think it would be found to be a valuable wood for the arts—*Halt.*

(8761) YEPY TREE. This name is applied in the Madras territories to two species of Bauhinia. *B*: *diphylla* and *B. Vahlii* the fibres of which are made into cordage: the *B. racemosa* "Malfhum" "Maljum" or "Maloo" grow in the hot valleys of the Himalayas, in the forests of the Sewalik Hills, from the doons of the North West to Assam. It is a magnificent climber and its product is known as "Patosa" or "bawal" fibre. *B Scandens*, grows not uncommon, about Gowhatti and common in Silhet: its fibre is equal in strength to that of Sunn Hemp and is made into cordage and cloth.

(8762) YEPY TREE BARK, Bauhinia Diphylla and B. Vahlii. These trees have a coarse brown bark of which the natives of India form a temporary rope for securing thatch, matting or fences. The Barks of several Bauhinias are used for similar purposes the Ara Na

is the bark of the B. parviflora, of which the matches of guns are made.

(8763) YEZAIEMAN, The most abundant supply and the best coal comes from Kinsin. I do not know how much there is in Nippow but there is none in Sikok.—*American Expedition to Japan, p.* 397.

(8764) YUCCA, a genus of Plants belonging to the section *Asparageæ*, of the natural order *Liliaceæ*. The corolla is inferior, bell-shaped, its segments without nectaries; stamens club-shaped; style none; berry hexagonal, of six cells; seeds numerous, flat. *Y. gloriosa*, Common Adam's-Needle, is a caulescent plant, with lanceolate straight furrowed leaves, their edges smooth and entire. This handsome plant is a native of Peru and North America. It grows on the shores of Caroline, where it blossoms in July and August its panicle of elegant flowers attaining a height of 10 or 12 feet. In British gardens the stem of this plant does not attain a height of more than 2 or 3 feet. *Y. aloifolia*, Aloe-Leaved Adam's-Needle, has linear-lanceolate even straight leaves, with the edges bordered by fine callous notches. This plant is a native of North and South America. *Y. draconis*, Drooping-Leaved Adam's-Needle, and *Y. filamentosa*, Thready Adam's-Needle, are cultivated in this country. The latter grows in the open air, and blossoms in the autumn. Its flowers are panicled and pendulous, and of a cream-colour. The leaves have their edges beset with long recurved threads.

(8765) YUCCA. Several species quite hardy They only require to be grown in places where water does not stagnate in winter; *Y. gloriosa*, *Y. filamentosa*, *Y Draconis*, *Y. flaccida*, and *Y. superba*, are the handsomest species.

(8766) YUCCA GLORIOSA, OR ADAM'S NEEDLE. *Adam's Needle*, or *Yucca gloriosa*, like others, seems sometimes to be called an Aloe The species of *Yucca* are natives of the southern provinces of the United States, and being there exposed to extremes, are capable of living in the open air, both in Europe and India. They are conspicuous for their noble show of lily-like white flowers, as well as for their long sword-shaped leaves terminated by a thorny point They, no doubt, all abound in fibre, as some of a fine quality and strong in nature, has been sent from Madras, separated from the leaves of the *Yucca angustifolia*. Other species flourish as far north as in the Botanic garden at Saharunpore. The fibres also take colour, as in the specimens sent from Madras, dyed red, orange, purple, and green. Fibre has also been separated from other species of Yucca, as *Y. aloifolia* and *Y. filamentosa*. These are amongst those which have received the name of silk-grass. Those sent from India are from two to four feet in length, and are rather wiry, or resemble those of the Agave more than they do the fibres of Bromelia.

The fibre of *Yucca gloriosa*, is Adam's needle, a strong, fine but rather stiff fibre, suited for the manufacture of cordage, it very soon becomes discolored by steeping, but is not so liable to rot as some of the other fibres of this kind. Very good specimens were exhibited by Dr. Riddell, Dr. Kirkpatrick and Revd. P. Methuselah; the plant does not appear to be abundant in Southern India, but grows easily and might be propagated to a great extent.

(8767) YUCCA ALOEFOLIA, produces a white, pliant and strong fibre, resembling that of the Agave in all respects, but is apt to be discolored by steeping, which the Agave is not.—*Royle. Riddell. M. E. Juries' Report.* Dr. Hunter has proved that the so called Aloe Plants, yielding fibres, are of great value, for a bundle bore 160 lbs when a similar one of Petersburgh hemp broke with the same weight. The fibre is two feet long, white and of fine quality, and readily takes colours. It was made from the A. perfoliata, *Kalabuntha*, which Dr. Royle supposes to be the same as his A. indica.—*Juries Reports M. E.*

(8768) YUNX TORQUILLA. This is the Ἴυγξ of the Greeks. Aristotle has well described the bird, its long tongue, its power of protruding and retracting it, and the writhing snake-like motion which it can impart to its neck without moving the rest of the body. ('Hist. Anim,' ii. 12.) It has been made familiar to most literary readers by the adjuration in the second Idyll of Theocritus ('Pharmaceutria'). It is also the *Iynx* of the Romans. (Pliny, xl. 47) *Yunx* in the form used by Linnæus and zoologists generally, but it ought to be *Iunx*, or *Iynx*. The Wryneck is the Torcol of the French, and also the Tercou, Torcou, Turcot, Tercot, and Torcot of the same, according to Belon; Torcicollo, Collatorto, Stortacoll, Capetorto, Vertilla, and Formicula, of the Italians; Gjoktyta of the Swedes; Bende-Hals of Brunnich; Natterwindl, Wendhals, Wendehals, and Dre-Hals, of the Germans; Long-Tongue, Emmet-Hunter, Snake-Bird, Cuckoo's-Mate, Cuckoo-Maid, Cuckoo's-Maid, and Cuckoo-Fool (two last Gloucestershire) of the English; Gwas y Gog and Gwddfdro of the Welsh; Arizui of the Japanese.

The male has the ground-colour of the plumage of the upper parts rusty ash-colour, irregularly spotted and speckled with brown and black; a large brown streak extends from the occiput to between the scapulars; on the external barbs of the wing-feathers rusty squared spots; tail-feathers bounded with black zig-zags; throat and front of the neck pale rusty, with small transverse black lines; bill and feet olive-brown: irides hazel or yellow-brown. Total length 7 inches. It is found in Denmark, Sweden (May), Germany, Holland (where it is rare), France

Spain, and Italy (summer); England, and Wales, Scotland (rare in the last and in the north of the first—summer); Kamtschatka (Viellot), Japan, Himalaya Mountains. Winter residences, North Africa and warm parts of Western Asia.—*Eng. Cyc.*

Z.

(8769) ZAFFER. ZAFRE. An impure oxide of cobalt, prepared by calcining its ores, and mixing the product with about twice its weight of finely powdered flint. It is used for communicating a blue colour to glass, porcelain, and earthenware; and when roasted with potashes, washed, and pulverized, forms *smalts*. (*Waterston.*)—*Faulkner.*

(8770) ZALACCA. A genus of palms with an edible fruit occurring in Malacca, Penang, Assam, and the Tenasserim Provinces, this species is known as "Salac koombar" in Penang, and "Salac Batool" also "Rungun" in Malacca, Assam Koombar and Assam Paiah. The leaves employed as thatch and for baskets &c.—*Seeman.*

(8771) ZALACCA EDULIS. EDIBLE ZALACCA Selung boat timber. A red scaly fruit produced by this species of zalacca may be often seen in bazar, but it is eaten by the natives only. The Selungs of the Mergui Archipelago shoot over their waters with remarkably light boats, and they owe their buoyancy to the materials that form their sides, which are the stems of the edible zalacca. These stems are as light, and of the consistency of cork, for which they are often substituted; and the Selungs are skilful in uniting them together to serve instead of planks, so as to make an unequalled sea boat, that floats on the waves like a swan.—*Mason.*

(8772) ZAMIA, a genus of Plants belonging to the natural order *Cycadaceæ*. The species of this genus are trees with a single cylindrical trunk, increasing by the development of a single terminal bud, and covered by the scaly bases of the leaves; the wood consists of concentric circles, the cellular zones between which are exceedingly loose, the ligneous tissue having the tubes marked by circular discs; the leaves are pinnated, not articulated, and have a gyrate vernation. The flowers are diœcious; the male flowers are arranged in tessellated catkins with abrupt scales, the anthers oval, sessile at the under side of each scale. The female flowers are in tessellated catkins, the scales peltate, drupes two at the under side of each scale. The species are found in the tropics of America and Asia, and also at the Cape of Good Hope and in Australia.—*Eng. Cyc.*

(8773) ZANONIA, a genus of Plants belonging to the natural order *Cucurbitaceæ*, named after James Zanoni. The only species belonging to this genus is *Z. Indica*, the Climbing Indian Cucumber. The fruit is described by Rheede as obscurely triangular, and having the flavour of the cucumber.—*Eng. Cyc.*

(8774) ZANTHOXYLEÆ, made up chiefly of genera placed by De Candolle in *Rutaceæ* and in *Terebinthaceæ*, are distinguished by their flowers being usually unisexual, by the calyx being free, petals hypogynous, equal in number to divisions of the calyx, ovaries subdistinct or united, each with two ovules, fruit indehiscent, carpids opening by a vertical suture, embryo in the axis of albumen. Many of the Zanthoxyleæ are remarkable for secreting a bitter principle, *Xanthopicrine*, and also a volatile oil of aromatic pungency. Thus several species of Zanthoxyleæ are employed as stimulants: one formed the *Faghureh* of Avicenna. Species of Ptelea and Toddalia are bitter and febrifuge. Both the species of Brucea are likewise bitter and tonic. *B. antidysenterica*, the Woginos of Bruce, is most celebrated, because it was long supposed to yield the Bark which was known as false Angustura, and from which the alkali *Brucia* was obtained; but the former is now well ascertained to be the bark of Strychnos Nux Vomica.—*Royle.*

(8775) ZANTHOXYLON RHETSA. RUTACEÆ. A large tree armed with sharp prickles; capsules have a strong aromatic taste; the seeds are used instead of pepper.—*Riddell.*

(8776) ZAPORNIA, Leach, a genus of Birds belonging to the family *Rallidæ*. The beak is slender, shorter than the head, acuminated, compressed, acute; upper mandible gradually incurved; nostrils linear, lateral, placed at the base of the beak. Legs long, slender, cleft, with three toes in front; the hinder toe elevated from the ground at its base; the tibiæ half naked. (Gould.)—*Eng. Cyc.*

(8777) ZAPORNIA PORZANA, the Spotted Crake. This is the Petit Rale d'Eau, Caouchouan, and Marouette of the French; Porcellana, Porzana, Grugnetto, Porciglione, and Gallinella, of the Italians; Punktiertes Rohrhuhn and Kleines Gesprenkeltes Wasserhuhn, of the Germans; Speckled Water-Hen and Skitty, of the English; and Dwfriar Fannog of the Welsh.

Adult and Old Male.—Forehead, eyebrows, and throat leaden-gray; sides of the head ash marked with black; upper parts olive-brown, but all the feathers black in the centre and variegated with small spots and stripes of pure

white; breast and lower parts olive, shaded with ash and marked with white spots—these spots are rounded on the breast, but disposed on the sides in transverse bands; middle tail-feathers bordered with white; lower tail coverts pure white; bill greenish-yellow, red at the base; feet greenish-yellow: iris brown. Length about 9 inches.

Adult Female.—Ash-colour of the throat and neck less extensive; sides of the head with brown spots; base of the bill with rather less red. It is found in Sweden (summer visitor, rare); Southern Russia; north of Germany and Holland (rare); France, Provence, and to the Mediterranean (more common). It is of most frequent occurrence in the south and east of Europe; it has been seen at Smyrna in the winter, and is stated to extend to India. It is a summer visitor in England, Scotland, and Wales, but is not common; and is occasionally found in Ireland in the summer.

The fine flavour of this bird is well known and appreciated in France. Few, if any, of the aquatic, or indeed of any tribe, can match it in autumn as a rich morsel for the table, especially if it be young. Colonel Hawker, speaking of the Common Water-Rail and this species, truly says, "Notwithstanding these two are seldom regarded by sportsmen, yet there is scarcely a greater delicacy than either the one or the other." Both are indeed first-rate, but the Spotted Crake for choice.—*Eng. Cyc.*

(8778) ZEA, a genus of Plants belonging to the natural order *Graminaceæ*. The name is identical with the Greek *Zeid*, but the Greek plant was a species of *Triticum* or *Hordeum*, and not at all agreeing with the present genus, which is entirely American.

The plants belonging to this genus are monœcious. The male flowers are in distinct spikes; the calyx consists of a 2-flowered blunt glume; the corolla of a blunt glume. In the female flowers the calyx in a 2-valved glume; also the corolla; the style is single, filiform, pendulous; the seeds solitary, immersed in an oblong receptacle. There are two species.—*Eng. Cyc.*

(8779) ZEA MAYS. INDIAN CORN, Lin.

Mukka Cholum, TAM.	Jaggon, MALAY.
Mukka Jooarie, DUK.	Yavanala, SANS.
Mokka Zonaloo, TEL.	Mokka, BENG.
Bhoottah HIND.	

Zea mayz, Common Maize, or Indian Corn, is known by its entire leaves. It is a native of America, and is cultivated there, as in most countries of Southern Europe. Like the species of *Triticum*, those of this genus present almost innumerable varieties, from the cultivation to which they have been submitted. As an article of food the fruit is much inferior to that of the *Triticum*, nor will it ripen its fruit fully in high northern latitudes.—*Eng. Cyc.* A native of South America, Hindostan, &c. cultivated extensively in Europe. The uses of Indian corn for alimentary purposes are too well known to need description here. The flour makes an excellent cataplasm. The stalks of the plant contain a considerable quantity of sugar, which has been economically manufactured in the crystalline state in several of the South American provinces.—*O'Shaughnessy, page* 636. Maize, or Indian corn, is more generally grown than millet, and "green corn" is a common article in market, but it is hard and insipid, decidedly inferior to American corn.—*Mason.*

(8780) ZEDOARY.

Zerukbad, ARAB.	Zedoaria, IT.
Shoothee, BENG.	Bengley, JAV.
Hinhooroo-pecallieulla, CYN.	Zerumbad, PERS.
Kutchoor, DUT.	Karchura, SANS.
Zedoaire, FR.	Cedoaria, SP.
Zittwer, GER.	Pulang-Kilungga, TAM.
Capoor-cachery, Kakhur, GUZ. HIND.	Keechlie-gudda, TEL.

The root of a plant which grows in Malabar, Ceylon, Cochin-China, &c. of which there are three distinct species. It is met with in pieces of various sizes, externally wrinkled, and of an ash colour, but internally of a brownish red. The odour of Zedoary is fragrant, and somewhat like that of camphor; the taste biting, aromatic, and bitterish, with some degree of acrimony. It was formerly employed in medicine, but is scarcely ever used by modern practitioners. (*Milburn's Oriental Commerce.*) Zedoary is imported into Bombay from China and the Malabar Coast; the former kind is preferred.—*Faulkner.* Mr. Colebroke applied this term to the roots of Curcuma Zedoaria, on account of the Persian and Arabic synonyms being Judwar and Zudwar. Clusius gives a plate of this Zedoary, the roots of which strikingly resemble those of A. atees. The Persians describe five kinds of Zedoary—Chinese, Nipalese, Tibetan, Dukunee, and Spanish. There can be little doubt but the Nirbisi is the true Zedoary of ancient writers, but its source is as yet unknown.—*O'Shaughnessy pages* 167-68.

(8781) ZEERA. CUMINUM CYMINUM, Cummin Seed; black and white. This is grown in beds the same as the coriander; the seeds are used for seasoning curries. Much is brought from China and the Persian Gulph.—*Riddell.* See ZIRA.

(8782) ZEOLITES, a family of Minerals, so named because the species generally melt and intumesce before the blowpipe, the term being derived from the Greek ζέω, to boil. They consist essentially of silica, alumina, and some alkali, with more or less water. The most of them gelatinise in acids, owing to the separation of the silica in a gelatinous state.

They occur filling cavities in rocks, constituting narrow seams, or implanted on the surface, and rarely in imbedded crystals; and never disseminated through the body of a rock, like crys-

tals of garnet or tourmaline. All occur in amygdaloid, and some of them occasionally in granite or gneiss. *Heulandite*, *Laumonite*, *Apophyllite*, and *Stilbite* have a strong pearly cleavage, and do not occur in fine fibrous crystallisations; when columnar, the structure is thin lamellar. Excepting *Laumonite*, these species dissolve in the strong acids, but do not gelatinise. The species *Natrolite*, *Scolecite*, *Stellite*, and *Thomsonite*, are often fibrous, and the crystallisations generally slender. The remaining species, *Harmotome*, *Analcime*, *Sodalite*, *Hauyne*, *Lapis-Lazuli*, and *Chabazite*, occur in short or stout glassy crystals, and are seldom fibrous. Some of these minerals are described under their proper names.—*Eng. Cyc.*

8783) ZEPHYRANTHES TUBISPATHA.

In Tenasserim, one or two species of zephyranthes of the amarylis tribe which were introduced from Dr. Carey's garden at Serampore, grow very well, and form handsome border flowers.—*Mason*

(8784) ZEUS. Russel.

Carrameen, Tam.

A Fish, Palankeen Boys Fish.—*Ains. Mat. Med. page* 155.

(8785) ZIMB, an Insect translated Hornet in Scripture (Exodus, chap. xxiii., ver. 28; Deut. vii. 20; Joshua xxiv. 12). The Hebrew name is 'tzirah,' and probably expresses its loud buzzing noise The account which Bruce has given of the 'zimb,' or Dog-Fly, of Abyssinia, offers such striking analogies to the insect specifically termed 'tzirah,' and included in the more general term 'zebub' of the Hebrew Scriptures, that very little doubt exists regarding the identity of the two. It is difficult to conceive that Isaiah could have had in view any other insect when he says—"The Lord shall hiss for the fly that is in the uttermost part of the rivers of Egypt" (Isaiah vii, 18). The original word rendered 'fly' in our translation is 'zebub,' and, as Bruce observes, "The Chaldee version is content with calling this animal simply 'zebub,' which signifies the fly in general, as we express it in English. The Arabs call it 'zimb' in their translation, which has the same general signification. The Ethiopic translation calls it 'tsaltsalya,' which is the true name of the particular fly in Geez, and was the same in Hebrew." Bruce has given a graphic account of this fly, and there can be little doubt that this insect is related to the family of *Astridæ*.

The Latin *Asilus* and the Greek οἶστρος were probably only different pronunciations of the same term 'ha-tsirah,' as this fly is called both by Moses and Joshua. Mr. Bracy Clark, in the 9th volume of the 'Linnæan Transactions,' part ii., 1843, refers the fly alluded to by Moses (and said to "hiss and make a noise") to *Œstrus bovis*, and remarks on Bruce's figure, that it has no resemblance to the genus of flies the *Cuterebra*, but is rather, though with something fictitious about it, allied to the genus *Stomoxys*, or perhaps *Tabanus*, both of which genera are certainly silent flies in their attacks on cattle.

There can be no doubt that the οἶστρος was a perfectly distinct insect from any of the modern *Æstrid*. (Kirby and Spence, *Introduction to Entomology.*) *Eng. Cyc,*

(8786) ZINC. Zincum.

Tootanagum, Tam. | Sungbusrie, Duk.

Zinc. This metal, in commerce frequently called *Spelter*, was first mentioned by Paracelsus, in the 16th century, under the name of *Zinetum*. It does not occur in the native state, but is obtained from its ores, which are chiefly the Sulphuret and Carbonate of Zinc.

A native sulphate of zinc, or blende was discovered by Mr. W. Mainwaring in the Madura province, but whether the brown yellow, or black blende, Ainslie had not been able to learn.—*Ains. Mat. Med. p.* 58. Zinc is considered to have been known as a distinct metal only since the time of Paracelsus. It has long been imported from China into India. The name *Tutenague*, by which Chinese Zinc was known in commerce, is evidently derived from the Tamul, *tutanagum* (Essay Hind. Med. p. 100), and it was at one time called Indian Tin (*Stannum Indicum*). The ores of Zinc were no doubt employed by the ancients in making Brass. Zinc (Zn=32) is found in the state of an Oxide, but principally as a Sulphuret (*Blende*), and an impure Carbonate (*Calamine*). From both ores it is first converted into an Oxide by the process of roasting, and then reduced to the metallic form by the aid of Carbonaceous matter, when it may either be fused or sublimed. Until purified by a second distillation, it contains as impurities small portions of other metals, as Iron, Copper, Arsenic, &c.—*Royle.* In a broken boulder that a native brought to Tavoy, was a large vein of some ore, that was judged to be black blende, or black sulphuret of zinc. Mr. Mason, was never able however to ascertain the locality whence it was brought. Dr. Helfer reported the existence of ores of zinc on the Mergui Islands. He says: "The other ores discovered are of less importance. They are arsenic and zinc. The latter may contain some silver.—*Mason.*

(8787) ZINCI SULPHAS, L. E. D. Sulphate of Zinc. *Sal Vitrioli. White Vitriol.*

Schwefelsaures Zink-oxyd, Ger. | Sulphate de Zinc, Fr.

This salt is found native in some places. It is known in India by the name of *suffed toota*, or white vitriol. (*v.* p. 149.)

Prop. Sulphate of Zinc (Zn O, S O_3—7 Ap.= 143) is a colourless salt, without odour, but having a disagreeable astringent and metallic taste.

(8788) ZINGIBERACEÆ, *Gingerworts*, a natural order of Endogenous Plants. The plants belonging to this order are herbaceous, possessing a creeping and often jointed rhizoma. Their

stem is formed of the cohering basis of the leaves, and is never branched. The leaves are simple and sheathing, the blade being often separated from the sheath by a taper neck; they have a single midrib, from which diverge at an acute angle numerous simple crowded veins. The flowers are arranged in a dense spike or raceme, or a sort of panicle, which is either terminal or radical. The flowers are supplied with spathaceous membranous bracts, which usually lie in pairs. The calyx is superior, tubular, 3-lobed, short. The corolla is tubular, irregular, with six segments in two whorls; the outer whorl is 3-parted, nearly equal; the inner is also 3-parted, and represents three stamens, the intermediate segment is larger than the rest, and called the labellum, and is often 3-lobed; the lateral segment is sometimes nearly abortive. The stamens are three, distinct, of which the two lateral are abortive, and the intermediate one fertile; this is placed opposite the labellum, and arises from the base of the intermediate segment of the outer series of the corolla; the filament is not petaloid, and often extends itself beyond the anther in the shape of a lobed or entire appendage; the anther is 2-celled, and opens longitudinally, the lobes often embracing the upper part of the style. The pollen is light, granular, globose, and smooth. The ovary is 3-celled; the ovule attached to a placenta in the axis; the style filiform, and the stigma dilated and hollow. The fruit is usually a 3-celled capsule, and sometimes from abortion 1-celled. The seeds are roundish or regularly angled, and sometimes with an aril; the albumen flowery; the embryo enclosed within a peculiar membrane called Vitellus, and Membrane of the Amnios by Brown. This order of plants has been mostly placed with *Marantaceæ*. It was first constituted by Brown, who pointed out the difference between it and *Marantaceæ*. The distinguishing characters of *Zingiberaceæ* are—first, the structure of the seed, in which a fleshy body is interposed between the embryo and the albumen, entirely enveloping the former. This body is called Vitellus by Brown, and is the remains of the innermost integument of the ovule, which is unabsorbed during the progress of the seed to maturity. A second peculiarity consists in the 2-celled anthers; and with this structure is combined decidedly aromatic properties. But the distinction between *Marantaceæ* and *Zingiberaceæ* depends, as pointed out by Lindley, on more important considerations than these. "In true *Zingiberaceæ*," he says, "as Brown has observed, the stamen is always placed opposite the labellum, or anterior division of the inner series of the corolla, and proceeds from the base of the posterior outer division; while the sterile stamens, when they exist, are stationed right and left of the labellum. But in *Marantaceæ* the fertile stamen is on one side of the labellum, occupying the place of one of the lateral sterile stamens of *Zingiberaceæ*. This peculiarity of arrangement indicates a higher degree of irregularity in *Marantaceæ* than in *Zingiberaceæ*, which also extends to the other parts of the flower." It contains 29 genera and 247 species. Nearly all the species are tropical plants, and by far the greater number inhabit various parts of the East Indies; they are also found in Africa and America. The plants belonging to this order possess great beauty, on account of the development of their floral envelopes and the rich colours of their bracts. They are also employed to a considerable extent in medicine and as condiments, on account of their aromatic stimulating properties. [CURCUMA; AMOMUM; ALPINIA.] *Zingiber* is known from the other genera by the inner limbs of the corolla having but one lip, and the anther having a simple recurved horn at the end.—*Eng. Cyc.*

(8789) ZINGIBER CASSUMMUNAR. YELLOW ZEDOARY.

Bun ada, HIND. and BENG.

Rhizoma much larger than that of common ginger, smell camphor-like, taste hot and bitterish (*Roxb. Fl. Ind* vol. i p. 49.) Now very little used.—*O'Shaughnessy, page* 643

(8790) ZINGIBER OFFICINALE. *Syn.* AMOMUM ZINGIBER, Linn. Narrow-leaved Ginger. Root—*O'Shaughnessy, page* 647.

Adrak, Ada, BENG. and HIND.

Zingiber Officinalis, the narrow-Leaved, or Common Ginger, has subsessile, linear-lanceolate, smooth leaves, elevated oblong spikes, acute bracts, and a 3-lobed lip. The root-stock of this plant is the ginger of commerce. It is imported into England from various quarters of the world, but more especially the East and West Indies. This plant is now grown in almost all parts of the globe in tropical climates, but it seems to have been originally indigenous in the East Indies. Ginger is one of the most agreeable of the hot aromatics, and is consequently much used as a condiment. It also enters into the composition of many medicines, where it acts as a carminative.—*Eng. Cyc.*

(8791) ZINGIBER ZERUMBET. *Syn.* AMOMUM ZERUMBET.

Butch. Mahaburee Butch, HIND. and BENG.

Found in the woods about Calcutta; the taste of the root resembles that of ginger, but is bitter as well as aromatic. It is not used in medicine by European practitioners.—*O'Shaughnessy, page* 648. *Zingiber Zerumbet*, the Broad-Leaved Ginger, is a native of the East Indies, and has delicate stems; bifarious, sessile lanceolate leaves; broad obovate bracts, and 3-lobed lip. This plant is much used in the East for cataplasms and fomentations, but is not taken internally.—*Eng. Cyc.*

(8792) ZINNIA, COMPOSITÆ. Zinnia elegans, alba, crocea and various others, may be all sown at the commencement of the rains, either

separately or in beds. The flowers are pretty and ornamental, and require very little care: the seed as it falls, springs up immediately, and from its profusion, almost becomes a weed in the garden.—*Riddell.*

(8793) ZIRA SUFAID. CUMINUM CYMINUM. CUMIN SEED. Plentiful about Ajmeer: much used in food and mesalihs.—*Gent. Med. Top. p.* 153. See ZEERA.

(8794) ZIRCON. Some of the best of the Ceylon jewels are probably zircon, the pale variety of which supplies the diamonds used in the jeweling of watches; and Jameson says, it is often sold as an inferior kind of diamond.—*Mason.*

(8795) ZIRCON. HYACINTH, JARGOON. A Mineral occurring in attached, imbedded, and loose crystals. Primary form a square prism. Cleavage parallel to the lateral planes, indistinct. Fracture conchoidal, undulating, brilliant. Hardness, scratches quartz. Brittle. Colour white, gray, red, reddish brown, brownish-orange, yellow, pale-green; streak white. Lustre adamantine. Doubly refractive in a high degree. Transparent; translucent; opaque. Specific gravity 4·505. Before the blow-pipe infusible, but loses its colour; with borax fuses into a transparent glass. It is found at Expailly, in France; Ceylon; at Friedrichsvarn, Norway; Greenland, the United States, &c. It contains—

Silica	33 3
Zirconia	66·7
	——100 *Eng. Cyc.*

(8796) ZIZYPHUS, *Ζίζυφον*, a genus of Plants belonging to the natural order *Rhamnaceæ*. It has a 5-cleft spreading calyx; 5 obovate unguiculate convolute petals; pentagonal flat disc, expanded and adhering to the tube of the calyx; a 2-3-celled ovary immersed in the disc; the styles 2 3: the fruit fleshy, containing a 1-2-celled nut; the seeds sessile, compressed, and very smooth. The species of this genus are shrubs, with alternate 3-nerved leaves, spiny stipules, and mucilaginous fruit, which is eatable. About 40 other species of *Zizyphus* have been described; amongst them the Z. *lotus*, which is the Lotus of the ancients. [LOTUS.] Many of them are natives of the Himalayas. Wherever they grow, they produce a fruit which may be eaten with impunity, although it varies much in its grateful and nutritious properties. *Z. Napeca* grows in Ceylon; *Z. xylophorus*, in Coromandel; and *Z. Jujuba* in China yield edible fruits. Dr. Wight gives Zizyphus glabrata, 282; Jujuba, 99; and Rugosa, 839.

(8797) ZIZYPHUS GLABRATA. RHAMNEÆ Icon. 282.

Kurkutta wood, English. | Kurkutta marum TAM.

A moderate sized tree but the timber excellent, hard, close grained and taking an excellent polish. It is of a light brownish, colour, and trees are met with that would give a 12 inch plank.—*Wight.*

(8798) ZIZYPHUS JUJUBA. *Syn.* RHAMNUS JUJUBA.

Vadari, SANS.	Gooly mara, CAN.
Usslie Suddir, ARAB.	Bér, HIND.
Kool, BENG.	Rega, TEL.
Yellanday marum, TAM.	Hyee-bin, BURM.
Elanjee mara, CAN.	

The wild *Ber* tree, is common almost every where; wood hard and useful, but of small size. It is used for making sandals. Wight No 127. Mysore 14, Bangalore 37.—*M.E.J.R. Ainslie.*

A small tree, a native of various parts of the East Indies and China, and common in gardens, where by grafting and cultivation it affords a large and very pleasant fruit called *Ber*. In Hindostan it is called *Berree* and *Jaree*, in Persia *Kinar* and *Kial*, in Arabia *Nebbek* and *Sidr*. Mr. Royle mentions that the fruit of the wild kind is dried and powdered, as was done with the lotus of the Lotophagi. This powder in Arabic is called *Sure koon nebek*, in Persian *Arud i kinar*, in Hindee *Ber choonee*. A lac insect inhabits the latter kind, and its produce is used for dyeing leather, cotton, and silk. The bark is used in the Moluccas as a remedy for diarrhœa; the root with some warm seeds in infusion in fever. The lozenges, and thickened mucilage called *jujubes* by the confectioners, are prepared from this and the Z. vulgaris, a native of Syria, Persia, and Hindostan.—*Royle's Illustr.* p. 17. A variety with long fruit, described by Dr. Walich, is called in Bengal *Narikeli kool.* —*O'Shaughnessy, page* 273.

The Fruit.

Elandei pullum. TAM.	Unab, ARAB.
Boyrkapull, DUK.	Budderie, SANS.
Regoopundoo, TEL.	

This is a pleasant tasted reddish colored fruit about the size of a large olive, but round. It grows in the woods and (*Ainslie*) is used in chatnies and pickles, being a very common tree n Madras. The Natives are very fond of the fruit when nearly ripe, it tastes like a Crab Apple. *Jaffrey.* The jujube from which the famous jujube lozenges are made, is this small sour berry, a great favorite with the Burmese and Karens. The tree is of middle stature, and is often found apparently growing wild.—*Mason.* This wood is used by the Natives for common purposes: it is that usually employed for making sandals.—*Ains. Mat. Med p.* 207. Tree usually of small size, but the wood fine grained and hard, fitted for cabinet making purposes. Nalla Regu is occasionally brought down the Godavery and answers to this description, but the Z. Jujuba is understood to be the common *Regu*, or Hind *Ber*, of which natives make sandals.—*Rohde.* In Pegu,

Zizyphus Jujuba, is scarce, being only found near large towns, rarely in the Pegu and Tounghoo forests; dark-brown wood.—*McClelland.*

(8799) ZIZYPHUS LOTUS, a native of Africa. This is the tree celebrated in ancient poetry as the Arbor Lotophagorum, the fruits of which were said by Homer to be as sweet as honey, and when eaten to destroy the love of country. The fruits, Polybius states, constituted the staple food of the districts in which they grew, and also yielded a delicious wine.—*O'Shaughnessy, page 272.*

(8800) ZIZYPHUS NAPECA, Willd.

Tsoora pullum, TAMIL.

This fruit, says Ainslie, I have never seen, but am led to suppose that it has not much to recommend it. It grows in the woods, near the mountains.—*Ainslie, p.* 233.

(8801) ZIZYPHUS ŒNOPLIA. *Syn.* Z. NAPECA, Roxb. Flora Ind. i. p. 13.

Koattay marum, TAMIL.

Common all over India, fruit eaten by the natives, its taste being pleasantly acid. A decoction of the bark of the fresh root is said to promote the healing of recent wounds.—*Roxb. O'Shaughnessy, page* 273.

Specimens of this were brought as belonging to the class of timbers. But if used at all, it can only be for small ornamental work. There are several of the tribe used as timber in the Circars, that called *Nalla Regu* is a useful straight grained timber, well suited for ordinary furniture.—*Rohde.*

(8802) ZIZYPHUS SPINA-CHRISTI, Christs Thorn, has ovate-toothed smooth leaves, pubescent beneath; prickles twin, one straight, the other incurved; the peduncles, corymbose; the drupe ovate-globose. This plant is about eight feet high, and is a native of the north of Africa of Palestine, Ethiopia, and Egypt. The flowers are yellowish-green. The fruit is oblong, about the size of a sloe, and much eaten in Egypt and Arabia, This plant has pliant branches, and is covered with thorns; and being not uncommon in Palestine, has been supposed by Hasselquist to have afforded materials for the crown of thorns with which Our Lord Jesus Christ was crowned. The *Paliurus aculeatus* however is the more common thorny plant in that country.—*Eng. Cyc.*

(8803) ZIZYPHUS TRINERVUS, CAROOKOOVA LEAF, Rottl.

Carookoova elly. TAMIL | Vatadella, SANS.

The leaves of this species of Zizyphus have but little taste or smell. A decoction of them in conjunction with others of the same nature, is occasionally prescribed to purify the blood in cases of Cachexia, and in Venereal complaints of long standing. The Telingas call this tree Kakoopala.—*Ains. Mat. Med. p.* 76.

(8804) ZIZYPHUS VULGARIS.

Ber, HIND.

The Common Jujube, has ovate-refuse toothed smooth leaves; prickles absent or twin; and an ovate-oblong drupe. This plant is a native of Syria, whence it has been introduced into Europe. It is now cultivated in many parts of the south of Europe, where its fruit is known by the name of Jujube. It has yellow-greenish flowers, two or three of which grow together. The fruit is of a blood-red or saffron colour, and has a sweet granular pulp. In Italy and Spain it is eaten as a dessert when fresh, and in the winter season as a dry sweetmeat. It is also sold in great quantities in the markets of Constantinople. The Jujube is commonly planted by the Turks of Constantinople before their coffee-houses for the sake of its shade,—*Eng. Cyc.* In India, this is a common wild fruit tree, and grows in almost every jungle. The fruit is astringent, but sometimes of a pleasant subacid flavor—eaten chiefly by the poorer classes, and wild animals. It is more especially cultivated by Mussulmans round their tombs. The fruit is oblong, containing a stone, and bears twice in the year, the best crop about January: after this is over, the tree is pruned, by cutting off nearly all the smaller branches. A second crop succeeds on the new wood in the rains, but, from being full of maggots, is not eatable: even in the cold weather very few of the fruit are free from this insect. The natives pretend that they have a remedy, which prevents the fruit from being attacked, but, says Dr. Riddell, I have never known it succeed. The flavour is somewhat that of a fresh apple, and the fruit when large and fine is by no means to be despised. He succeeded best by budding from a good tree on a common stock raised from seed. It will bear well in two or three years, but requires care and watering at first. A fine gum-lac is produced from this tree; the cocoon of the wild silk worm is often found attached to it.—*Riddell.*

(8805) ZIZYPHUS XYLOPYRA, RHAMNEÆ.

Gotti, TEL.

A small thorny tree, fruit round, used by the moochies for blackening leather.—*Riddell.* It is common in every forest on the coast of Coromandel. In a good soil it grows to be a pretty large tree, with a tolerably erect trunk, but in general it is found in the state of a large straggling shrub. Cattle eat the leaves, young shoots, and fruit. The kernels taste like filberts, and are eaten by the natives. The wood of the largest trees is much esteemed by the natives, being yellowish or orange colored, very hard, and durable, and at the same time not very heavy.—*Rohde M.E.S.*

(8806) ZOANTHARIA. ('Animal Flower.' from the Greek ζῶον and ἄνθος), the third class of true Zoophytes, in the arrangement of De Blainville, and defined by him thus:—"Body regular, flower-shaped, more or less elongated, free or fixed, very contractile, furnished with an intestinal canal, without distinct walls, having a single large terminal opening surrounded by variously-shaped tentacula, which are always tubular and

in communication with the musculo-cavernous parenchyma of the skin." The terms of this definition are in part incorrect, there being no intestinal canal properly so called, but a large bag-shaped stomach having distinct walls.

The *Zoantharia* may be grouped under four very natural families, namely :—

I. *Lucernariadæ*, the animals included in which are soft and simple, fixed by a small base or free, and having the tentacula in groups at regular distances on the margin of a campanulate disc, in the centre of which is the mouth.

II. *Actiniadæ* : animals all soft and simple, fixed or free ; when fixed, adhering by a broad base ; the tentacula in most species developed and surrounding the margin of the oral disc.

III. *Zoanthidæ* : animals coriaceous, simple or compound, fixed ; tentacula marginal, surrounding the mouth.

IV. *Madreporidæ* (including the *Madrephylliæa* of D. Blainville : animals forming a solid calcareous polypidom ; in other respects they resemble the *Actiniadæ*.—*Eng. Cyc.*

(8807) ZONURIDÆ, a family of Saurain Reptiles possessing the following characters :—Head pyramidal or depressed, covered with regular many-sided shields. Tongue flat, nicked at the tip. Scales of the back and tail large, rhombic. Sides with a distinct longitudinal fold, covered with small granular scales. Ears distinct. Eyes with two valvular lids. Limbs four, strong, or rarely entirely wanting or hid under the skin.

(8808) *Tachydromus sexlineatus*, the Tachydrome, is a tropical form of this family, and is found in Cochin-China, China, Borneo and Java.

(8809) ZOZYMUS (Leach), a genus of Brachyurous *Crustacea*, placed by M. Milne-Edwards in the division of Cryptopod Cancerians, between the genera *Carpilius* and *Lagostoma*.

Zozymus is hardly distinguishable except by the form of the claws, the extremity of which is enlarged and deeply hollowed out into a spoon-shape, a disposition which most influences the habits of the animal. It tends also, in his opinion, to establish the passage between the genera *Cancer* and *Xantho* ; for he finds no character sufficiently precise to separate from it certain species, the general form of which is slightly less oval than that of the crabs properly so called, and the latero-posterior borders of whose carapace are nearly as long as the antero-posterior borders, which become strongly dentilated.—*Eng. Cyc.*

(8810) ZOZYMUS ÆNEUS has the carapace moderately large, convex, very unequal, strongly embossed, and nearly tuberculous at its posterior part ; front slightly advanced and indistinctly divided into four lobes ; latero-anterior borders of the carapace not prolonged beyond the level of the genital region, and armed with four very wide teeth, compressed and united after the manner of a crest ; anterior feet tubercular externally ; the succeeding feet hollowed with furrows on their external surface. Length from about 2 to 3 inches : colour yellowish with reddish spots. It is found in the Indian Ocean.—*Eng. Cyc.*

(8811) ZUR-DOZEE OR EMBROIDERY : (ZUR-DOZEE) is an art, in which the Mahomedans of India display a great degree of skill almost equal to that exhibited by the Hindoos in weaving. They embroider Cashmere Shawls and Scarfs, also Muslins, and Net fabrics with silk, gold and silver thread. These fabrics are much esteemed in Great Britain and are probably still unrivalled by similar productions in any part of the world.

Another branch of needle-work allied to embroidery, which is carried on there, is that of flowering or ornamenting Cloths with Cotton thread (Chickan-kavi.) The dresses of Mahomedans are frequently worked in this manner, and two descriptions of it called Tartor and Sumunderludur, in which the texture of the cloth is broken down with the needle, and converted into network, are held in the highest estimation.—*Dr. Taylor.*

(8812) ZURUMBAD.—CURCUMA.—Zerumbet.—Zeodary ; 4 sorts. See HULDEE.

THE END.

WORKS OF MR. BALFOUR.

SOLD BY

Mr. Higginbotham, Madras; or Messrs. Richardson, Brothers, Cornhill, London.

Price Rs. 35 or £3 10, bound. 1 vol. 2054 Pages, Royal 8vo.

CYCLOPÆDIA OF INDIA AND OF EASTERN AND SOUTHERN ASIA, COMMERCIAL, INDUSTRIAL AND SCIENTIFIC; PRODUCTS OF THE MINERAL, VEGETABLE AND ANIMAL KINGDOMS, USEFUL ARTS AND MANUFACTURES, MADRAS 1857-8.

BY EDWARD BALFOUR, L. R. C. S. E.,

Surgeon Madras Army, Officer in charge of the Government Central Museum, Madras; and Honorary Secretary Madras Exhibition of 1849.

Formerly, Honorary Secretary to the Madras Central Committee for the Great Exhibition held in London in 1851; Honorary Secretary Madras Exhibitions of 1855 and of 1857; and Secretary Madras Central Committee for the Universal Exposition held in Paris in 1855.

OPINIONS.

From the Madras Journal of Literature and Science, of the Madras Literary Society and Auxiliary Royal Asiatic Society.

(Vide p. 314 New Ser. Vol., ii. No, vi. Old Series, Vol. xviii. No. 43.)

"The Library of the Society has been furnished by Government with a copy of the *Cyclopædia of India and Eastern Asia*, By Edward Balfour, L. R. C. S. E., Surgeon, Madras Army. It is issued in Nos. of 100 pages each. Four Nos. have already appeared, containing in all 2,755 words, which reach as far as C in the Alphabetical arrangement.

"Such a work undertaken by one man, and one too engaged upon numerous other duties, however studious and diligent he may be, cannot but contain many imperfections. The author himself is aware of this, but having long felt the want of some portable book of reference on scientific and economic subjects connected with Eastern countries, he has liberally come forward with his services, and has laid the foundation stone as it were of a work which is intended to supply that want. There is no question but that his long residence in India, his Scientific researches and his very variety of duties eminently fit him for a work of this character, which however imperfect and incomplete as a whole, will be of great utility, and prove a valuable aid to others who may wish to walk in his footsteps. That there will be found such others willing to aid in the good word we feel assured."

Extract from the Minutes of Consultation of the Right Hon'ble the Governor of Madras in Council, under date the 18*th June*, No. 812, 1857.

The work offers to supply much useful information, and is in the opinion of Government, worthy of encouragement.

HE INFLUENCE EXERCISED BY TREES ON THE CLIMATE AND PRODUCTIVENESS OF A COUNTRY;

BY EDWARD BALFOUR, L. R. C. S. E.,

MADRAS, 1848. 8vo.

FROM SIR HENRY CONYNGHAM MONTGOMERY, BART., *Secretary to Government Fort St. George.*

Revenue Department, Fort St. George, 8th September, No. 982 of 1848.

To E. G. BALFOUR, ESQ., *Assistant Surgeon.*

SIR,—I am directed by the Right Honorable the Governor in Council to acknowledge the receipt of your letter dated 31st March 1848, transmitting copy of Notes taken by you on the "Effect of Trees on the Climate and Productiveness of a Country. The Right Honorable the Governor in Council has perused with much pleasure and satisfaction the valuable and very interesting information contained in this paper, and in transmitting for your information the resolution passed on the occasion, desires to convey the thanks of this Government for your communication.

(Signed) H. C. MONTGOMERY, *Secretary to Government.*

Revenue Department, No. 981, Extract from the Minutes of Consultation, under date the 8th September 1848. Read the following letter from Assistant Surgeon Edward Balfour. (Here enter 31st March No. 701, 1848.)

Para 1. The Right Honorable the Governor in Council has perused with much pleasure and satisfaction the valuable and very interesting report furnished by Assistant Surgeon Balfour on the "Effect of Trees on the Climate and Productiveness of a Country, and deeming it of importance that the Local Revenue Officers should be in possession of information so intimately connected with the welfare of the Districts under their respective charges, he resolves to direct that copies of the same be printed at the Fort St. George Gazette Press for general distribution and for transmission to the Government of India and the Government of Bengal, Bombay, and Agra, and the Honorable the Court of Directors. * * * * The Governor in Council resolves to furnish to Assistant Surgeon Balfour a copy of the foregoing proceeding and to convey to him at the same time the thanks of Government for his interesting communication.

(Signed) H. C. MONTGOMERY, *Secretary to Government.*

Letter from Major (now Colonel) REID, C. B., *Secretary to the Madras Agri-Horticultural Society*; To the Secretary to the Board of Revenue.

3. The Committee are happy to have it in their power to forward a very ably written paper on this subject (*vide Printed Report already before the Government of India*) from the pen of Assistant Surgeon Edward Balfour of the 5th Regiment N.I. This document was originally intended by Mr. Balfour to have been sent direct to Government; but; changing his mind, he forwarded it to the Secretary of the Horticultural Society to be finally sent through them to its original destination. The Committee would beg the Board to bring this document to the especial notice of Government. * * *

(Signed) F. A. REID, *Secretary.*

STATISTICS OF CHOLERA,

BY EDWARD BALFOUR, L. R. C. S. E.,

MADRAS, 1849, 8vo.

Madras Medical Board, to Madras Government, in letter dated 9th August, No. 171, *of* 1849.

"By Assistant Surgeon Balfour of this establishment, and to state that, in the "opinion of the Board, the performance is highly creditable, and testifies to the abi- "lity and zeal of that officer; it is a paper in every point of view, well worthy of "publication."

Extract from the Minutes of Consultation of the Right Hon'ble the Governor of Madras in Council, dated 21st August, No. 3055 of 1849.

"Grants authority for printing the work, by Assistant Surgeon Balfour, submit- "ted with the foregoing letter." * * * "The Right Hon'ble the Governor in Council, notices the favourable testimony borne by the Medical Board, to Assistant Surgeon Balfour's ability and zeal."

The Hon'ble the Court of Directors in letter dated, 9th April No. 39, 1850. "These proceedings have our sanction. We notice with satisfaction the testimony borne to Assistant Surgeon Balfour's zeal and ability."

Lancet, London, April 20, 1850.

* * "As a contribution to the statistics of Cholera the pamphlet of Mr. Balfour is the most important work that has appeared for a long time."

Register General's Report on Cholera, London, 1852.—p. xcix.

"The fact is placed beyond doubt by the statistical analyses of Assistant Surgeon "Balfour. * * * See some good observations on the movement of troops in the "Statistics of Cholera by Assistant Surgeon Edward Balfour."

Price Rs. 7 or 14 Shillings. 1 vol. 8vo.

ELEGANTLY PRINTED IN ARABESQUE.

THE GOOLDUSTEH-I-SOOHN, BEING SELECTIONS FROM THE PERSIAN AND HINDUSTANI POETS, MADRAS, 1851.

BY EDWARD BALFOUR, L. R. C. S. E.

From Madras Athenæum, January 16.

We have received a grateful present of a curious and pretty book. It is a collection of passages from the Hindostance and Persian poets all in the Persian character, so long and so universally admired for its great beauty and engraved on richly ornamented pages. The origin of this fine volume is due to Dr. Balfour the Government Agent at Chepauk. Having for some years past, employed his leisure hours in collecting what appeared to him to be the finest passages in Eastern poetry, Dr. Balfour resolved to have the collection published in an Eastern style. He therefore gave copies of the verses which he had gathered to the Mussulman Syed Hoosain, known as "Koosh Navees," or "the beautiful writer," by whom they were copied into the elegant and flowing hand-writing of Persia. The whole work lithographed by the Hakeem Syed Mahomed consists of two hundred and fifty-two octavo pages, luxuriantly ornamented by two Hindoos, Rung Rajoo and Wakand Rajoo, after Mussulman fashion, with designs of flowers and fruits, and such other illustrations as a follower of the Arabian Prophet—forbidden to draw the likeness of any living creature, for fear of furnishing a hint or seduction to idolatry,—may indulge his pencil in pourtraying. Each page has its own distinct design, and both the position and the space occupied by the writing, are regulated by the form and profuseness of these fanciful and beautiful illustrations. We have here then a

pure specimen of Eastern ornamental writing, the designs being left to the taste of the writer and the ornamentors, lithographed by a Mussulman and bound up after Mussulman fashion. The title of the work is Gool-Dustah-i-Soohn, or "the Bouquet of Language." We learn that parties desirous of possessing themselves of copies of this volume, which is valuable both as a great curiosity and on account of its real merits as a work of art, will have an opportunity of supplying themselves at the *Athenæum* Office.

From Madras United Service Gazette, January 17,

We have been favoured by Dr. Balfour with a copy of his Selections from the Persian and Hindostani poets, being a collection of the finest passages in Eastern Poetry, compiled by this accomplished Orientalist in the course of his reading, and now published in a volume appropriately entitled Gooldusta-i-Sukhoon or the "Persian Anthology." The work does infinite credit to Dr. Balfour's taste as an Oriental Scholar. It is in the Persian character from the pen of Syed Husseiyn; known as "Khoosh Nuvees," lithographed by Syed Mahomed, the pages richly ornamented with Arabesques of infinitely varied design, and appropriately bound in the Mahomedan fashion. To Oriental Students we commend this volume of "Elegant Extracts," as such in the truest sense of the word, and acquaint them that it is procurable at the *Athenæum* Library.

Price Rs. 5 or 10s. 1 vol. 8vo.

CONQUEST'S OUTLINES OF MIDWIFERY, IN DIGLOT HINDUSTANI AND ENGLISH, Madras, 1850.

BY EDWARD BALFOUR, L. R. C. S. E.

Persian and Hindustani Translator to Government.

Extract from the Minutes of Consultation, dated 13th June, No. 500 of 1850. Read the following letter from the Secretary to the Medical Board. Here enter 4th May 1850.

Para 1. The Right Honorable the Governor in Council observes that very favourable testimony is borne, both by the Council of Education in Bengal and by the Principal of the Delhi College, to the merits of Dr. Balfour's translation into Hindustani of Dr. Conquest's Outlines of Midwifery and * * * it is a work calculated to promote the extension of much useful knowledge among Hindustani students in an important branch of the Medical Department. * * *

True Extract. (Signed) H. C. Montgomery, *Chief Secretary.*

From the Secretary Council of Education (Bengal); To J. P. Grant, Esq., Secretary Government of Bengal, Fort William, 1st December 1849.

2. The Council are of opinion that the work would be most valuable to the Hindustani students of the Medical College and to the Native Doctors generally throughout the country, and beg strongly to recommend that it be published upon the terms mentioned by Dr. Balfour.

5. The Council are of opinion that great credit is due to Dr. Balfour for the ability with which he has executed a very difficult task. The diffusion of sound principles connected with the practical departments of medicine cannot fail to be most useful when made known in a vernacular language current among so large a portion of the population of Hindustan. All such attempts to be useful as that of Dr. Balfour are therefore deemed by the Council to be most deserving the patronage and encouragement of the Government of India. *Vide letter from the Secretary to the Council of Education of Bengal to the Secretary to the Government of Bengal, dated 1st December* 1849.

From Dr. A. Sprenger, Principal Delhi College, To F. J. Mouat, Esq., Secretary Council of Education.

"Considering that this is the first attempt of translating a work on Midwifery into Oordoo, the manner in which it is executed reflects the highest credit on Dr. Balfour. It is everywhere intelligible and many passages are elegant as far as the subject admits, and every friend of Native Education will be delighted to see so useful a book published." *Letter from Dr. A. Sprenger, Principal of the Delhi College to the Secretary to the Council of Education of Bengal, dated 18th October* 1849.

From Dr. F. J. Mouat, Secretary Council of Education, To J. P. Grant, Esq., Secretary to the Government of Bengal, Fort William, 4th February, No. 238, of 1850.

The difficulty of procuring such works may be estimated from the fact that although they have for some years been sanctioned by Government the only one in progress is the Manual of Anatomy by Dr. Mouat: a mere fragment of the Treatise on Medicine and Surgery having been prepared at Delhi.

(Signed) F. J. MOUAT, M. D., *Secretary Council of Education.*

From the Medical Board, Madras, in Letter from Dr. Lorimer, Secretary, dated 13th September 1852.

* * * Assistant Surgeon Balfour's Hindustani translation of Dr. Conquest's Midwifery, is a work which is highly creditable to him as a Medical Officer and a Hindustani scholar.

(Signed) A. LORIMER, *Secretary, Medical Board.*

FORT ST. GEORGE, 13*th September* 1852.

Price one Rupee. On rollers, cloth.

BAROMETRICAL SECTIONS OF INDIA, SHOWING THE APPROXIMATE ALTITUDES OF THE LOCALITIES THROUGH WHICH THEY ARE DRAWN. WITH A DESCRIPTION OF THE PHYSICAL FEATURES OF THE COUNTRY AND OF ITS CIVIL AND MILITARY DIVISIONS,

BY EDWARD BALFOUR, L. R. C. S. E.

MADRAS 1853.

The objects and aim of the above publication will be gathered from its preface. The publication of these Barometrical Sections has been undertaken with the hope of assisting the inquiries of the Geologist, the Engineer, and the Statesman, and

it has been thought desirable to bring them into a connected form, for the benefit of the English public, by an outline of the physical features of this country and a short description of its Military and Civil divisions: an Index Map is likewise given to allow the eye to catch, at a glance, the different Sections in the volume. It is hoped that this outline may ultimately be filled in by detailed descriptions of Provinces, for the vast Empire of British India will not receive justice until the examination of its various features be undertaken on a scale commensurate with their magnitude. Its climate, and its Agricultural and Manufacturing Industries have had some attention paid to them, and a few scientific men have described parts of its animal, vegetable and mineral productions: but its geology, its flora and fauna, as a whole, have yet to be attended to, and its hydrography is a great want. No general description has ever been given of the many nations, races and wandering tribes that we rule over, here, nor of their varied manners, their dwellings and physical character: nor of their languages, dress or food; though the value of any one, or all of these, if treated as a whole, would be inestimable, and it is to be hoped that, in addition to their immediate advantages, the Barometrical Sections may assist those who have leisure to undertake inquiries from which so much general benefit would result.

Proceedings of the Geographical Society, Bombay.

"It was remarked on Dr. Balfour's Barometric sections, which gave rise to these observations,—the Bombay Government having requested the opinion of the society as to their merits,—that they furnished a very valuble contribution to Physical Geography for which the Meteorologist and Geologist must feel most grateful. The Society were not in a postion to test their accuracy, but from the fame of Dr. Balfour, there could be no doubt that every precaution had been taken to render them correct."—Proceedings Bombay Geographical Society, of 21st, as published in *Bombay Times*, 27th, August 1856.

Price Rs. 5 or 10 shillings. 1 vol. 8vo.

THE LOCALITIES IN INDIA EXEMPT FROM CHOLERA,

BY EDWARD BALFOUR, L. R. C. S. E.

MADRAS, 1856.

From the Witness, Edinburgh, Wednesday, December 3, 1856.

Dr. Balfour, an able Surgeon at Madras, has just published a curious volume of Reports on Cholera. He started some years ago a theory that there were many places absolutely exempt from the scourge. Investigation has confirmed this opinion. In Madras alone there are thousands of villages which have never felt the visitation, though surrounded by infected districts. Minute lists are supplied and each place is to be separately examined.

* * *

From the Friend of India.

We require, however, further facts and it is to their collection that the attention of Doctors and Statists all over the earth should be directed. One volume of such data has reached our hands. It has been prepared by Dr. Balfour of Madras, one of the Surgeons who show us what the Company's Service under favourable circumstances might become. With an industry none the less creditable from the sameness of the task, he has hunted up the facts of the case from every Zillah of his own Presidency. Mysore furnishes a most valuable mass of statistics, and even Scinde and the Dekhan contribute a few figures not without their value. We have not space or indeed time to condense the mass of tables furnished by Dr. Balfour, but * * * the enquiry is of the highest importance and the Madras Government would confer a benefit on humanity by enabling Dr. Balfour to devote himself to this especial end.

From the *Fort St. George Gazette*, No. 3055, Dated 5th September *1856 p. 339.*

The following Notification is published for the information of the Authorities concerned.

NOTIFICATION.

Deeming the investigation into the remote and proximate causes of Cholera, upon which Dr. Balfour is engaged, to be one of great interest and importance, the Right Honorable the Governor in Council is pleased to direct that all Civil, Political, Military and Medical authorities will afford to that Officer every assistance in their power, and supply him with such information as he may seek in the prosecution of his enquiries.

By order of the Right Honorable the Governor in Council.

(Signed) T. PYCROFT, *Chief Secretary.*

From the Bombay Times.

A very interesting work has just been published by Dr. Balfour of the Madras Army, on the Localities in India exempt from Cholera, and this forms an element for an addition to our physical Atlases, we were not prepared for. A set of cholera or pestilence maps for India * * * would bring under the eye at once in graphic form the vast mass of facts here appearing as statistics. * * Dr. Balfour does not confine himself to dry Tables or abstracts; but gives in his narrative an account of the geological and other leading features of the country.. * * The work is one of the many Dr. Balfour has given to the world where the mass of printed matter affords a very inadequate idea of the amount of labour expended on its preparation for the press, or the very great value of the facts comprised within the narrowest limits that can be assigned to them.

Price Rs. 2 8 0 or 5 shillings. folio.

THE COMMERCIAL PRODUCTS OF THE MADRAS PRESIDENCY, AS SHEWN BY ITS EXPORTS AND IMPORTS, THEIR QUANTITIES AND VALUES, FOR THE FOUR YEARS 1852-53 TO 1855-56 INCLUSIVE, MADRAS, 1857.

BY EDWARD BALFOUR, L. R. C. S. E.

Revenue Board, Fort St. George, Revenue Consultation No. 54 of 2nd June 1857.

* * The paper compiled by Dr. Balfour will be a useful record for reference in the offices of the Board and the several Maritime Collectors. * * The arrangement adopted by Dr. Balfour is clear and precise. * * *

From the Madras Athenæum.

An unpretending publication has just been issued from the Scotch Mission Press, containing in a small compass, much information of interest to all whose pursuits require them to know in what the commercial wealth of this country consists. Styled "the commercial products of the Madras Presidency, as shown by its Exports and Imports, their quantities and values, for the four years 1852-53, to 1855 56 inclusive," it gives in detail every article of Export and Import forming the trade of the whole Madras Presidency. The value, of the total exports for that period, we observe, stated at Rs. 14,32,93,799 and that of the Imports at Rs. 11,35,20,461.

* * * These are some of the thoughts which have occurred to us from a hasty glance at these Commercial Tables, which we received yesterday; we will

refer to them again at leisure, as the matter they contain is of great general importance. * * We consider they supply a general want which we ourselves have often felt.—*Madras Athenæum, March* 3, 1857.

Price Rs. 10 or £1. 1 vol. 8vo. Bound.
